I meant sXXX so 0.0 to 9.9 then 10 to 999 inches...

I think it is lxxx and if is greater than 1000 then it becomes Lxxx
where you can think of the L as the onethousands digit...

I dont have it in front of me, but that is the gyst of it..

Bob

That's going to be rather confusing in the future. Both wind speed and snow in the same packet have the same identifier for the field.

> > 2) Rainfall in last 24 hours. I assume this is intended to be a rolling count going backwards from the current time 24 hours, and not the amount of rain that was seen yesterday. "last 24 hours" implies a rolling count to me. I'm fairly sure on this one, just checking.

>

> Yes. I think only the original APRSdos does this. Newer programs took the simpler approach of starting the count at midnight...

Xastir does this (as of Saturday): Keeps 24 hourly data buckets and uses them to come up with the 24-hour rain and the since-midnight rain totals. The 24-hour rain is the difference between current rain total and the lowest rain_total stored in the 24 buckets. Seemed like the right way to do it.

> > 3) The "Other parameters" _letters_ are defined, but the number of bytes for each field are not.

> > I'll assume 'L' has 4 bytes (L999) YES

> > 's' has ?? bytes? Format? (s1.25, s100.99) NO. 3 fixed bytes

Ok. So we can transmit inches of snow from "s00" to "s99", and not fractional inches? Is that intended to be snow base or fresh snow? If fresh snow, what timeframe?

You deleted the below line from your response. 'l' is in the spec also under the "Other parameters" heading, supposed to be luminosity greater than 1000. Not knowing the range for luminosity, do I assume that a 1000 gets added to a three digit value to give the final result for the 'l' field?

> > 'l' has ?? bytes? (11000, 110000, 11000000000)

So a value of 1500 would be encoded as "1500" ?? Can luminosity ever be greater than 1999?

Well, the spec allows "... " or " " for the fields. It also allows any field to be absent, as long as it's not one of the few required fields at the beginning.

Area Object Questions:

1) Does anyone have any info yet about Area Objects? We still have no information about how to implement circles, ellipses, or triangles. The starting "corner" point is the main question here: Circles and ellipses have a surprising lack of corner points, and

triangles definitely need some more explanation in the spec as well. Perhaps circles/ellipses are defined with the lat/long point being the center of the object? The upper left corner point of the box the circle/ellipse would fit inside? Same for rectangles: is the lat/long point the right-angle corner, or perhaps the upper left corner of the rectangle it would fit inside?
Bob?

2) What sort of triangle? What do the transmitted numbers mean for a triangle? Right-angle triangle? Isosceles triangle? Which corner is the reference point? Perhaps it could be defined as an isosceles triangle with the right-angle being the reference corner, the two transmitted parameters defining: 1) The rotation angle, and 2) The length of the equal sides in feet/meters?
Bob?

The example given in the spec for triangles would seem to imply a right-angle triangle, with the right-angle at the lat/long reference point, and two sides of variable lengths going vertically and horizontally from that point. This means only four triangles could be drawn, with sides of different lengths:

End result: I wouldn't be able to draw a triangle of any other rotation. Imagine a search where I knew the direction of travel to be northerly due to tracks being found, but I couldn't draw a triangle on the search area that angled upwards (imagine a funnel pointing straight down)?

Actually the spec also says the lat/long point defines the upper left corner of the object, and that the object is drawn to the right and down from this point. That would mean we could draw one and only one rotation of triangle, but of different sizes (third triangle in the diagrams above).

3) For circles: Does it have to be a circle in lat/long, or could it be a more useful circle with a constant radius (distance-wise)? The spec says lat/long, which isn't as useful as say a circle of 0.5 miles radius. The main reason is that it will look like an ellipse instead of a circle most places in the world. In order to get objects that look like circles on the map screen we have to draw ellipses and carefully calculate the lat/long distances so that it ends up a circle at the particular latitude. A real pain. I'd much rather see circles defined with a distance parameter in feet or

meters, and perhaps keep ellipses defined in terms of lat/long.
Bob?

4) Unless circles and ellipses are defined differently, why have
circles at all? Ellipses can be circles.
Bob?

One of the shareware APRS programs appears to have incorrect sizing
for the area objects, and they also go the wrong direction from the
corner point w.r.t. what the spec says.

>ever be greater than 1999?

Certainly it is going to be greater than that in about 5E9 years, when
the Sun is expanding to become a red giant star and engulfing the
inner planets :-).

However, if that luminosity is over that anytime soon, we are in very
very great troubles and some APRS message overflows are the least
things to worry in that situation.

The full spectrum solar flux density at Earth's orbit (150 million km)
is about 1400 W/m² and since the atmosphere filters out all X-ray,
most UV, a large part of mid IR and attenuates also the visible light
and the thermal IR window, so only about 1000 W/m² will reach the
surface.

If a solar panel with 10 % efficiency is aimed towards the sun, you
should expect up to 100 W of electric power for each square meter of
panels.

I assume these luminosity figures in the APRS message refers to
luminosity perpendicular to the sun rays and not the luminosity
falling on a square meter of horizontal ground. Is this assumption
correct ?

Paul OH3LWR

Yes, that is correct

Yes. Lower right. the offsets then define the distance back to the upper
left.

The triangle is just a specialized LINE. Draw the line using the rules for LINES. Then make it into an isosceles triangle symmetrical about the vertical axis. Thus you can only draw isosceles triangles and only with the base down...

> End result: I wouldn't be able to draw a triangle of any other
> rotation. Imagine a search where I knew the direction of travel

Use the LINE with a WIDTH. Im not sure that any of the other authors implemented LINE WIDTHS, but APRSdos did. This way you can draw a rectangle at any angle, showing a corridor or other such shape...

> 3) For circles: Does it have to be a circle in lat/long, or could it
> be a more useful circle with a constant radius (distance-wise)?

COnstant radius. APRSdos always scales a map so that there is no distortion based on latitude. THus, a circle is a circle...

> spec says lat/long, which isn't as useful as say a circle of 0.5
> miles radius. The main reason is that it will look like an ellipse
> instead of a circle most places in the world.

a 50 mile circle is an ellipse on any mercator projection map. That is why APRSdos scales all map screens to latitude to eliminate that distortion. Most other authors have not done that.

It doesnt matter what the radius of the circle is defined in. It can be inches, feet furlongs, or minutes of latitude. It is still a circle...

> rather see circles defined with a distance parameter in feet or
> meters, and perhaps keep ellipses defined in terms of lat/long.

It is a constant radius.,

> 4) Unless circles and ellipses are defined differently, why have
> circles at all? Ellipses can be circles.

Actually, we never did ellipses. The only drefinitiosn in APRS are circles, lines boxes and triangles. There was no interest in doing ellipses..

> One of the shareware APRS programs appears to have incorrect sizing

> corner point w.r.t. what the spec says.

Yep, I have been fighting this for years. There seems to be
little interest in fixing it...

Which? I asked two questions that were entirely different. This is an important point for me.

Is the point:

- 1) The center of the circle?
- 2) The upper left corner point of the box it would fit inside?
- 3) The lower right corner point of the box it would fit inside?

Which one?

> The triangle is just a specialized LINE. Draw the line using the rules

> the base down...

Bummer. That makes them next to useless for what I was intending. I'd much rather have an isosceles triangle with a rotation angle and a length. I can always make them with line objects, but it's more complicated.

Constant radius in distance is not the same as constant radius in lat/long. For Xastir we have the hooks in there to be able to scale the X/Y so that the distance is correct in either direction, no matter where you are on the globe. The formulas aren't in there to calculate this properly yet, but they probably will be soon.

A circle in our case would be defined with a radius in a distance measurement, not in a lat/long measurement. One defined with lat/long would be an ellipse, at least where I live.

I'm most interested currently in SAR applications, where the commander might ask me to put a 1-mile circle around the point last seen. I'd certainly rather have a circle there than an ellipse which was caused by the "circle" being defined in lat/long.

For me to draw a circle defined in lat/long, I'd have to draw an ellipse and carefully compute the two radius (radii?) for my latitude so that it came out as a circle. Below you mention though that ellipses were never part of any APRS software. I have no way to draw a circle on my screen unless I implement ellipses.

> It doesnt matter what the radius of the circle is defined in. It can be
> inches, feet furlongs, or minutes of latitude. It is still a circle...

Disagree. Depends on the map projection entirely. It may look like a circle on your screen, but not on any equi-distant projection. A circle for me would look like an ellipse for you.

> Actually, we never did elipses. The only drefinitiosn in APRS are
> circles, lines boxes and triangles. There was no interest in doing
> elipses..

I'll assume you meant APRSdos.

Then the APRS spec is wrong, or someone was getting ahead of themselves in defining things that don't exist in any APRS software.

Is anyone collecting bugs/omissions in the spec with the intention of

correcting them someday? I've learned things about objects and weather recently and would like to see them get into the spec someday. I suppose Ian is burned out on spec writing by now.

Can I judge by the overwhelming response that there really isn't

anyone doing this?

I'd say that is a good guess.

The problem is, by appearances, it would seem the APRS-WG no longer exists, although some might claim otherwise. One thing is certain, the majority of members are now inactive and new volunteers to replace them have been turned away (or more likely ignored). I see no disgrace in resigning from a organization that one has done a good job serving on, yet now lack the interest/time to actively contribute to it.

Lacking that, probably the thing to do is form a non-profit corporation for the purpose of administering the spec. It might be possible to even re-use the existing document as the copyright claimant (APRS-WG) is not a legal entity (although that could change, and in any case would likely not be a good course of action to pursue.... best to ask first).

Hmmmm.... I know CVS can be used in non source code applications... maybe it is time to source forge this document/activity so those that are interested can participate.

Hello people!

I am testing some APRS packet beaconing and i am having some problems.
I'll give you some examples, maybe you can help me:

With !3853.73N/009.02.07W>010/005 /A=000123 UIView recognizes the Car,
but does not show Course/Speed and Altitude.

With @231010z3853.73/009.02.07W>010/005 /A=000123 UIView recognizes
the Car, shows Course/Speed but does not show the Altitude.
I tested this packet with WinAprs and the same happens.

I need Altitude !!!

I went through all the protocol, and found that these packets are ok. But i
may be wrong.

Can anyone help me ??

Thanks for it!

Thats not the problem...

I made a mistake when i wrote the email.

Of course, it should be 3843.73N 00902.07W.

I have seen that spaces in front of the /A= sometimes causes programs to miss the altitude. I separated the altitude information from the comment field in the digipeater database specifically so that I could control where it is placed in the posit files to correct a multitude of such errors received in the source data...

It may also be that UIVIEW is expecting the altitude to be proceeded by a PHGxxxx value; try your beacons as follows, and report the results:

!3853.73N/00902.07W>010/005/A=000123

!3853.73N/00902.07W>010/005PHG1110/A=000123

The altitude should not be consider part of the comment field, but rather an optional portion of the fixed-format position. At least a few programs consider it this way, whether the specification says so or not.

Glad someone is checking things. The location of the "/A=" is supposed to be allowed anywhere after the ICON character.... Since that is where the optional COMMENT string may begin... (IMHO).... Bob

This is part of a private reply from Bob. I asked his permission
to post portions of it to the list.

Perhaps someday if a volunteer shows up to put out a revised spec,
this info and the recent weather info about snow fields, luminosity,
and raw rain counter can be put into the spec. Since there are no
examples for these, the number of bytes in each field is undefined
in the spec. Also the "s" flag for Snow conflicts with another
implementation regarding sustained one-minute wind speed.

Note that the spec does not fully specify the fields for the additional weather fields possible (details from Bob in an earlier message to the aprsspec list), and for Area Objects, ellipses were never implemented, and the reference "corner" and direction for the offsets for all Area Objects/Items is incorrect in the spec. The spec also doesn't specify how to define a triangle or a circle properly. Circles have no corners, and triangles can be defined many ways. See the below and earlier messages from Bob in the aprsspec list for the definitions.

Also consider putting in a reference packet for each type of object so that the sizes and reference points can be checked in a new APRS implementation. We're currently noticing that our objects and Bob's objects are of different sizes. Wah.

No, I only see one answer. Yes..

The point is the center. The offset is the upper left corner defined as the corner of the box it fits into...

> Is the point:
> 1) The center of the circle?
> 2) The upper left corner point of the box it would fit inside?

Your original question I don't recall seeing any reference to the lower right. If so, it is not involved.

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tapr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.
- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with ≥this is off-topica≤ then you are violating this rule.
- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)
- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)
- . Do not send messages in HTML or Rich Text format.
- . Do not send attachments.
- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)
- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Stan Horzepa, WA1LOU, wallou@tapr.org

Here are the codes for two test objects:

```
;CIRCLE *071423z3900.00N/07200.00W/15211325 with a radius of 22.3 mi  
;RECTANGLE*071424z3900.00N/07200.00W/19321331 47mi high by 35 mi wide
```

The LINE would be the same as the diagonal for the box and the Triangle would be an isoceses triange made out of the diagonal and another side symetrical about the vertical axis.

Hope that helps

I've tried also without the space in front of the /A=, and it turned out the same.

I dont want to use the PHGxxxx, because this is a mobile beacon and if there is an Altitude /A= described and available in the APRS protocol, why shouldnt we use it ??

I guess the problem remains in the APRS software out there..... just a guess....

Usually that technique does not work... APRS programs have to do an awful lot of parsing and display. There are probably hundreds of combinations. You may find something that the author has not.

If you do not communicate this to the original author of the program so that he is personally aware of what you are seeing, then the chances are very small that he is going to ever find the little bug you are seeing. And with the hundreds of other things on his TO-DO list, it probably is way down the list.

So, the authors all like to fix their programs, but they need feedback from the users. Give them the full details and I bet you will find each of them will be more than happy to work with you to fix it. With 200 EMail's a day on the APRS SIG's, do not expect a complaint there to be read by an author. Too easy to miss.

If you see a bug, write the author directly...
I bet you will be amazed at the results...

Bob

Antonio,
Do this, please: Open a UI-View terminal window. Select the text from that window. Copy it. Paste it into an eMail and send it to the list. Do not hand-transcribe it (due to errors that may occur). Once it is examined exactly as you receive it, we can help to diagnose it better for you.

Ev, W2EV

This is not correct. Reports starting with the @ sign are supposed to
include a timestamp. Change the @ to '=' if you are able to accept APRS
messages, or to '!' if you cannot accept messages, and you should get the
results you are hoping for.

Unfortunately not.
I added the time stamp to the frame:

@231011z3853.73N/00902.07W>123/050/A=001234

And it still does not work in UIView.

With ISS and UO22 in orbit and digipeating APRS packets and the imminent launch of PCsat and SAPPHIRE, we need a consistent way to build SATGATES for injecting APRS packets into the APRS Internet system. This is my suggested DRAFT SATGATE spec:

SPACECRAFT that DIGIPEAT AX.25 packets: (* after Sept 2001)
ISS via NOCALL, downlink 145.800 1200 baud
UO22 via UOSAT5, downlink 435.120 9600 baud +/- Doppler
OPAL via KF6RFX, downlink 437.100 9600 baud +/- Doppler
*PCsat via PCSAT, downlink 145.825 and 144.39 1200 and 9600 baud
*SAPPHIRE v TBD, downlink 437.100 1200 baud +/- Doppler

Of these, ISS and PCsat will be the most popular by far, since they are EASY to do with an OMNI whip antenna and NO Doppler tuning and 1200 baud.

Most packets will probably be Mic-E (Kenwood) packets due to the mission to support mobile and handheld APRS communications. Packets heard on the downlink will be of the form:

FROMCALL>TOCALL,SATLITE*:packet....

Where the SATLITE* indicates the packet was digipeated from that Satellite. The purpose of this SATGATE SPEC is to define what happens to the packet once it hits the ground. We want to identify on WHAT downlink it was heard and WHICH SATGATE injected it into the APRS Internet system. To this end, I propose the following standard:

SATGATES will have a unique SSID associated with each of its receiver ports so that we can tell on which port a packet was heard. Thus, I suggest the following SSID defaults for the SATGATE calls:

- 1 PCSAT 1200 baud on 145.825
- 2 PCsat 9600 baud on 145.825
- 4 U022 9600 baud on 435.120
- 7 OPAL or SAPPHIRE on 437.100
- 11 PCsat 1200 baud on 144.39
- 12 PCsat 9600 baud on 144.39
- 15 ISS 1200 baud on 145.800

SATGATES will REBUILD the path of the original packet by INSERTING their CALLSIGN,TCPIP* AFTER the satellites digipeater callsign. Using the above example, the packet will be inserted into the INTERNET using the existing TAPR-2 ASCII standard as follows:

```
FROMCALL>TOCALL,SATLITE*,SATGATE-SS*,TCPIP*:packet.....
```

Where SS is the 0-15 SATGATE SSID indicating the receiver port of this SATGATE used to copy the above packet.

NOTE: I see no reason why this standard cannot also apply to all packets injected into the APRS Internet system as a means of identifying the IGATE and the port of origin into the network... but that is a separate issue..

As Bob was/is a member of the APRS-WG, does this mean the WG (if they still presently exist) is now accepting extensions to the protocol? I seem to recall a number of people submitted extensions, and were politely told it would have to wait until the spec was done. Some of these extensions were as well written as Bob's.

Not complaining, but to give the "appearance" of fairness, it might be prudent to also address those at this time. Of course, if the WG has disbanded, I guess it is just a matter of who puts the most pressure on the authors to adopt whatever they promote.

Just thought I'd point that out, if anyone cares.

-Jeff

I have to concur with Jeff on this... at a minimum it should have been
formally announced that the working group was re-opening itself to
considering extensions..

This is not meant to denigrate both good efforts and well intended actions on the part of the authors... I for one am thankful for the contribution from all those who have made their good efforts available.

I for one made a proposal a couple of years back that the UI Frame digipeat function should be modified to accommodate delay in retransmission.... An experiment I ran at the time (and posted on the APRS Sig) showed that for unconnected packets... many TNC's did not use any delay in retransmission... every digipeater immediately retransmitted UI frame packets... and thus only stations that were out of hearing from all but one... had any chance of hearing the digipeat.... connected mode packets were the only packets that acted properly in listening before transmissions....

Several folks noted how that was informative.. but the proposal (for one example) died.... I was looking forward for some open-source digi code (that could be installed on digipeating capable TNC's without an ancillary PC) that I could "hack" on to make this happen... and I still have hope that Marco will release UIDigi source (as he stated he would in his Beta testing days).... now I'm looking forward to HH III code being open sourced... and have acquired AVR development hardware and software to assist me in doing this.... I think it has the potential to be a DYNAMITE project... sort of a Kenwood that allows Hams to go in and work on the code themselves..... and maybe Phil Karns proposal to AMSAT will come to fruition and allow the same... THANKYOU PHIL for making the case for an Open Source solution....

I know it's been ranted and raved here in the past that there are doers and there are talkers... but I know for a fact some doers have gone ahead and done some stuff (ex: UIView, PropNet) and it was called into question and even slammed... maybe these too ought to have the option to propose their extensions as submissions...

Also there were those who wanted to establish telemetry standards (a single weather format rather than the tower of babel) and they were sidelined..

What's good for one should be good for all...

Jeff, as you recall, Steve Dimse never published an IGate spec, nor has
anyone ever put the existing mess down on paper. After the last round of

serious volunteers to put it together for the WG here on the SIG, nothing ever came of it.

Nothing has changed.

The WG is willing to address a draft spec if someone will put it together. In the meantime, we have a timely need to solve the problem of SATGATES. In that vein, I proposed the draft addressing only that issue.

Bob

I wasn't talking about a IGate spec, or Steve Dimse. I was talking about
the numerous people who wrote extensions specs who were politely told they
had to wait. Allan already brought up one, and I know there are others.

>Nothing has changed.
>The WG is willing to address a draft spec if someone will put it together.

Go in the archives then.... I'm just saying in fairness, the ones
before yours should be addressed first. Assuming, and that is a
big assumption, that the WG still exists, why do you feel your rights
to have a proposal considered should override those that have had
proposals sitting on the table for a year or more?

The problem with insisting the WG still is a viable body, as you seem
to keep doing, is occasionally someone will call you to task on it. I
am doing this. So, since you insist the WG is a viable body, then
do the right and fair thing, and open the spec to extensions and release
the holds that were put on other people's suggested extensions.

Why is this so hard to understand?

Just for the record -- Bob's email is the first that I, and I suspect other, members of the WG have heard about this proposal. It's not even clear to me that he intended it to be considered by the WG, since he addressed it to a very public mailing list, didn't separately cc at least two WG members (Mike Musick and me), and did cc two non-WG members (Steve Dimse and Roger Barker). I can assure you that the WG is not working on this, or frankly any other, proposal.

Whether the WG is still alive or not is a good question. Neither TAPR nor I own or control the group, and if the members would rather spend their time elsewhere, there's not much that can be done about that. People naturally want to spend their hobby time doing what's fun and relaxing, and I can assure you from personal experience that developing a protocol specification in the ham environment is neither.

As an aside, I'll also note that despite all the hoohah several months ago about an APRS internet spec, and all the people volunteering to work on it,

and the WG offering at least informal support,* not much more has been heard about that project since. Perhaps the WG isn't the only group realizing how they'd rather spend their time. (I'm not saying that to cast aspersions on the folks who volunteered, who I know all had the best of intentions; I'm merely pointing out what is a pretty predictable pattern in these matters.)

73,
John N8UR
jra@febo.com

* In looking at my mail files, I don't see that the WG took a formal vote to that effect or made a public statement, but I do see that Bill Diaz, who was instrumental in the server discussions, was cc'd on several emails where support from several WG members was informally offered.

> considering extensions..
<snip>

Huh? Tabloid misinformation again?

There has been no such announcement. Only Jeff's off-the-wall confusing and inflamitory inference to mix up apples and oranges.

Here is what is going on. I posted a draft of a backwards compatible idea for SATGATES to inject data into the Internet to meet an emergent need. Let me clarify it for those who may be confused:

- 1) This has nothing to do with the APRS SPEC
- 2) This has nothing to do with the never written IGate SPEC
- 3) This is an emergent need to solve the SATGATE problem.
- 4) This is not an invitation for additions to the APRS SPEC 1.0
- 5) The invitation **still stands** for anyone to draft an IGate spec

If discussions about the SATGATE problem inspires someone to draft the long awaited IGATE protocol spec (to document what Steve originally implemented) for submission to the APRSWG then the WG is MORE THAN WILLING TO ACCEPT and review such a submission...

In the meantime, I need authors to add some backwards compatible SATGATE code to what we already have so that we can get some SATGATES on line... and know where the packets are coming from.

Huh?

No one has said anything about opening up for the next version of the
APRS SPEC when we dont even have an INTERNET SPEC. We must have an
internet spec (which is what the majority of the APRS infrastructure is
all about) before we start messing up what is working now.

> ... So, since you insist the WG is a viable body, then
> do the right and fair thing, and open the spec to extensions and release

No way are we going to start messing around with a version 2 of the APRS
SPEC when we dont even have a draft INTERNET SPEC.

> Why is this so hard to understand?

Good question! It seems perfectly clear to me.

```

This violates the typical TNC protocol, where only the last-transmitting station is starred. Granted, there are other violations of this, e.g.

K4HG>WU2Z*,WIDE4-2:...

Where although WU2Z is starred, the packets has already been retransmitted by two WIDEn-n's, AFAIK there has never been an occasion before where there are two stars, this has a high risk of breaking a lot of existing applications.

Can you explain more about why this is such an emergent issue? Just as findu.com can easily identify packets retransmitted by ISS (NOCALL*), each of these other sats have digi IDs that are unique. About the only thing I can see different is this could differentiate the 9600 port from the 1200 port on PCSAT, is this such an important issue?

Steve K4HG

That is why it is important to allow new blood into the group. I understand
12 people volunteered, maybe it is time to fill some of the open/inactive slots.

Whatever, I posted a rough outline and no-one commented on it, including the
principles. It is one thing volunteering, another doing something, and yet another
even getting recognition for what you have done. Think about it.

It is either time to get the WG back into gear, or close up shop and declare
victory. This limbo you and the WG insist on keeping in place is not productive.

I posted a rough outline of a internet spec, and had the FTP manager of TAPR even open a group about this. ME, not someone else. Not much, mind you, but people would rather bitch and moan on this list then do anything. And when someone does do something, it often is ignored or "deffered".

Not a single person commented on my outline, yeah or nay, WG or otherwise. You can only try so hard Bob.

I'm really tired of hearing this broken record from you and TAPR how no-one volunteers or does anything. It is complete BS.

OOPS! I see now that I confused what it looks like AFTER going back to RF on the existing system with what it looks like GOING IN. Sorry...

The main reason that I want to do something different is so that we can preserve the identification of the SATGATE that injected it; which the current IGATE process does not do.

So, drop the TCPIP* from my suggestion. THus, I think all I am proposing is that SATGATES simply insert their CALL* at the end of the path before inserting into the internet.

Your point is well taken whether any prior *'s should be eliminated.

BUT, I have seen existing TNC's that put a * by all digi fields that have the has-been-used bit set. SO having multiple *'s should not be a precedence. If there is code that is confused by this, then that code will not work with existing TNC's some of which do insert multiple *'s... So I hope that it is not a problem.

back to ya....

Bob

I never commented on what you submitted, because it was essentially a cut
and paste of what others had produced before. If the APRS Internet System
spec were going to take 1000 hours, you have done 10. 1% of a job is
nothing I'd take particular pride over!

>I'm really tired of hearing this broken record from you and TAPR how no-one

>

So you think you do 1% of the job and others should do 99%? That speaks
volumes about you, Jeff.

I've said for years not including each IP station ID in the path was my
greatest error in designing the APRS IS, inserting this before the TCPIP*
would cause no problems as far as I can see.

>So, drop the TCPIP* from my suggestion. Thus, I think all I am proposing
>is that SATGATES simply insert their CALL* at the end of the path before

>

That still leaves two *'s, right? again, I'm not sure how existing
software will respond to this.

The TCPIP* is used by several things on the APRS IS, I think removing it
would cause problems, certainly on an unverified connection it would
cause the data to be dropped.

>BUT, I have seen existing TNC's that put a * by all digi fields that have

Which do this? I have never seen it. I'm very unsure my code would not
break if faced with this, I've never tested it...

Thanks for your kind words of encouragement. However, unlike you, I do not take protocol development as a "king of the hill" kind of endeavor. I approach it as a open source effort.... where even a "1% of a job" means something. Being that NO-ONE, including yourself, was doing anything, I thought my "1% of a job" might focus people. Sorry it didn't rise to your standards.

> >I'm really tired of hearing this broken record from you and TAPR how no-one

1% of something is better then 100% of nothing, which is what we have now. In any case, I only offered it as outline, which in technical writing is a good place to start.

>That speaks volumes about you, Jeff.

A discussion with you wouldn't go anywhere without you getting personal, would it?

Do you care to speak volumes about me Steve on this group? Have at it Steve, I'd love to hear what you think about me.

-Jeff

Case-in-point. Yep, that is the problem. You tried to get someone to help you flesh it out. Just like we have requested over and over. But still no one has found time to do the work of putting a draft together. I dont blame anyone, everyone is busy. But I wish you would stop blaming the WG when you also have experienced the same problem. Someone has got to do the work and not just whine about it...

> Not a single person commented on my outline, yeah or nay, WG or otherwise.
> You can only try so hard Bob.

That is what we have been saying all along. You claimed to have all these volunteers all lined up to put together an IGate SPEC... yet even your own attempt by drafting an outline also went no where...

> I'm really tired of hearing this broken record from you and TAPR how no-one
> volunteers or does anything.

We don't complain. You are the only one that complains. We simply state facts. That is... no one has drafted an IGate SPEC. If somone will take the time to draft an IGATE SPEC to document what currently exists, then the WG is more than happy to review it for formal adoption.

We do not blame volunteers for not volunteering. We simply recognize that people that can really get things done are busy. And those that can't really contribute anything useful are sometimes pretty good at complaining about everyone else...

But you see, this is exactly the problem. There needs to be the 99% guy.
Ian was that guy for the APRS spec, and so far there is no one for that
job with the APRS IS spec. So you do 1% of the job (a number you admit
is realistic) and then you start flaming others for not doing the 99%!
I'm not going to be the 99% guy, obviously neither are you. So, Bob and
TAPR tell the truth, that there is no other 99% guy in the wings, and you
make their fault. That is extremely unfair!

So yes,

Yes, but you were correct that it should not be on the packet going INTO
the internet. SO I was only talking about removing it from my
erroneous initial suggestion. Not from things as they are. Whatever an
IGate does to the packet before sending it back to RF (including putting
the TCPIP* on it is a separate issue...)?

Concerning having multiple *'s in a TNC header:

> Which do this? I have never seen it. I'm very unsure my code would not
> break if faced with this, I've never tested it...

It shocked me when I saw it, but the DSP-12's do it...

First of all, you are hearing what you want to hear, and
not what is being said. I don't expect that to change,
but I'll try anyways

WHY DOES THERE NEED TO BE A 99% guy? Tell me, I'd like to know. And
HOW DO YOU KNOW, I WOULDN'T HAVE BEEN THAT 99% GUY? Are you so arrogant
that you actually believe this stuff?

Fact of that matter is, I was looking for some feedback, of which I got
none. I even privately e-mailed you, no response. This is no way for TAPR
to treat volunteers, be they "99% guys" or "1% guys". Every little bit
helps.

>Ian was that guy for the APRS spec, and so far there is no one for that
>job with the APRS IS spec. So you do 1% of the job (a number you admit
>is realistic) and then you start flaming others for not doing the 99%!

Another "I'm Steve and if I say it, it must be true". Who am I flaming
prior to this message? I simply stated, if the WG still exists, then
amendments to the spec should go through it, and prior proposals should
be considered on a first come first server basis.

Please comment on the above and tell me how this is unreasonable.

>I'm not going to be the 99% guy, obviously neither are you.

"And obviously neither are you"? You really are arrogant, aren't you?
I wrote a rough outline.... who is to say I wouldn't have continued on
it if I got some feedback, any feedback. And I certainly still could,
I'd just like a little feedback. I'm sure Ian didn't work in a vacuum
and whoever writes the APRSSERVE spec shouldn't be expected to either.

Read what I post, not what you think I am thinking. It would go a long

way into stopping these Elvis and the Aliens type responses.

Thanks

Jeff

Again, read what I say, not what you think I am thinking.

>you flesh it out.

Exactly. See we can agree on things occasionally.

>Just like we have requested over and over. But still
>no one has found time to do the work of putting a draft together.

Here is my issue, and lets use Steve's numbers of 1000 hours for a
APRS-SERVE draft.

I don't trust the WG even exists or cares anymore. Maybe it is just me,
but you have to admit, no official action has occurred over a year. So
you expect a person, on faith, to invest 1000 hours of there time when
the WG may just be a black hole? If one invests 10 hours of there time,
and cannot get a single comment, encourage or discouraging, that seems
like a good litmus test that no-one really cares or that the WG is just
a black hole.

>I don't
>blame anyone, everyone is busy. But I wish you would stop blaming the WG
>when you also have experienced the same problem. Someone has got to do
>the work and not just whine about it...

I'm not blaming the WG or blaming you.... clearly you put alot of work
into your SATGATE draft and you should be commended for it. And at least
you are getting some comments on here, unlike my experience. (and in
fairness, I just remembered, Bill Diaz did critique it off SIG with me)

But, again, listen to what I was saying. I'm just suggesting that there
is supposed to be a process in place for amendments to the APRS spec.
You claim to be a present member of the WG, so you of anyone should
appreciate what I am saying. I am simply saying that other extensions to
the APRS spec had been proposed in the past, should these not also be
consider at the same time, or ahead of yours?

Unlike others, I don't buy the argument "Well Bob didn't say he was
posting as a member of the WG". That is wishy washing weasel word thinking.
For a
spec to be effective, it has to be enforced. It is a black and white
issue. There is either a process, or there is not a process.

That is *all* I am saying.

>
> > Not a single person commented on my outline, yeah or nay, WG or
> otherwise.
> > You can only try so hard Bob.
>
> That is what we have been saying all along. You claimed to have all these
> volunteers all lined up to put together an IGate SPEC...

I made NO SUCH claim. You are thinking of Bill Diaz. I never volunteered to be on the APRS-WG, and I only offered to help Bill if he didn't have enough people (and I believe he did have enough). That much being said, I saw the APRS-Igate spec discussion going no where, so I took some of *my* time, and wrote up a rough draft outline hoping to get a few comments from some of the group. I got nothing.

> > I'm really tired of hearing this broken record from you and TAPR how
> no-one
> > volunteers or does anything.
>
> We don't complain. You are the only one that complains. We simply state
> facts. That is... no one has drafted an IGate SPEC.

So, Ian worked in a vacuum with no prior input from the WG and only presented the fully polished document. Come on, that is not how a protocol process works. Sorry, can't fool me because I have been on some industry groups doing this stuff.

> If someone will take
> the time to draft an IGATE SPEC to document what currently exists, then
> the WG is more than happy to review it

Sure, let me know if this is on the right track:

<http://www.tapr.org/tapr/list-archive/aprsspec/0102/msg00024.html>

and I'll keep adding to it. Sorry, I am not a fan of "build it and they will come" mindset and feel this should be a cooperative effort.

> We do not blame volunteers for not volunteering. We simply recognize that
> people that can really get things done are busy. And those that can't

>really contribute anything useful are sometimes pretty good at complaining
>about everyone else...

Complaining? Again, for the point challenged, let me state again what
I was saying here:

If the WG still exists, there is a process for submitting additions
to the protocol. Recognizing this, there are other additions that
were submitted by other people that were tabled. If indeed this
APRS-WG still exists, then these amendments should now be considered.

If you consider the above "complaining", power to you brother, but what
I am saying really seems self evident to me. It either is, or it isn't.
Can't be both at the same time as some would like us to believe. A
protocol spec, to be effective, must be black and white, including the
political process behind it. To do otherwise is to do a disservice to
the ones you wish to enforce this on.

Then again, maybe I am involved in to many industry groups that won't
put up with this kind of stuff..... oh well.

-Jeff

Do you guys have any idea how hard it is to fit any interest into a discussion of this sort, which really has some interesting AND IMPORTANT ramifications, when so many different individuals are sniping, whining or name calling?

Can we, for a little while, ease off and stick to technical aspects of the discussion? No personal vendetta, no dismissal out of hand because of who said it, no off-color remarks and no name calling?

Thanks.

Here is the SATGATE proposal completely REDONE to correct my confusing use of the TCPIP* alias. Also, I have re-written it to distinguish between "requirements" and "preferences"...

APRS SATGATE Specification (draft)

PURPOSE:

With ISS, OPAL and UO22 in orbit and digipeating APRS packets and the imminent launch of PCsat and SAPPHIRE, we need a consistent and backwards compatible way to build SATGATES for injecting APRS packets into the APRS Internet system. The existing IGate process has no traceability to the source of the packet. This proposal attempts to identify the SATGATE using the existing DIGIPEATER fields for backwards compatibility.

BACKGROUND: There are now and will be more SPACECRAFT that DIGIPEAT AX.25 packets: (Those marked with * launch in Sept 2001)

- ISS via NOCALL, downlink 145.800 1200 baud
- UO22 via UOSAT5, downlink 435.120 9600 baud +/- Doppler
- OPAL via KF6RFX, downlink 437.100 9600 baud +/- Doppler
- *PCsat via PCSAT, downlink 145.825 and 144.39 1200 and 9600 baud
- *SAPPHIRE v TBD, downlink 437.100 1200 baud +/- Doppler
- *STARSHINE periodic telemetry donwlink on 145.825 9600 baud

Of these, ISS and PCsat will be the most popular by far, since they are EASY to do with an OMNI whip antenna and NO Doppler tuning and 1200 baud.

ASSUMPTIONS: UI Packets heard on the downlinks will be from either the satellite itself or a digipeated packet from a user of the form:

SATCALL>TOCALL:telemetry.or.other.data (From the satellite)
FROMCALL>TOCALL,SATLITE*:packet.data.... (from users)

Where the SATLITE* indicates the packet was digipeated from that Satellite. The purpose of this SATGATE SPEC is to define what happens to the packet once it hits the ground. We want to identify on WHAT downlink it was heard and WHICH SATGATE injected it into the APRS Internet system. To this end, I propose the following requirement:

REQUIREMENT: Satgates will take the ASCII TAPR-2 header of such packet and rebuild it to ADD the SATGATE's CALLSIGN* after the last existing DIGI* before injecting the ASCII TAPR-2 header and packet into the Internet. Thus, it simply looks like the SATGATE "digipeated" the packet. In other words, it then looks like this:

```
SATCALL>TOCALL,SATGATE*:telemetry.or.other.data
FROMCALL>TOCALL,SATELITE*,SATGATE*:packet.data....
```

COMMENT: Steve has pointed out that some existing software may croak on seeing two or more **'s, but I note that the DSP-12 TNC has always used multiple **'s and so this is not a new precedent. Existing code has to already search for the last * in the path to be compatible with this TNC.

OPERATIONAL PREFERENCES: When SATGATE operators set up their SATGATE, I think it would be nice if SATGATES chose a consistent SSID associated with each of its receiver ports so that we can tell on which port a packet was heard. Thus, I suggest SYSOPS use the following SSID defaults for their SATGATE callisigns:

YOURCALL-1	1200 baud	on 145.825	(PCsat-1 operates there)
YOURCALL-2	9600 baud	on 145.825	(PCsat-2 operates there)
YOURCALL-5	9600 baud	on 435.120	(UOSAT5 operates there)
YOURCALL-7	1200 baud	on 437.100	(SAPPHIRE operates there)
YOURCALL-12	9600 baud	on 144.39	(PCsat can operate there)*
YOURCALL-15	1200 baud	on 145.800	(ISS operates there)

Note that PCsat also has the capability to downlink BULLETINS on 144.39 over North America, but these will be used infrequently and will get into the existing APRS IGate system independent of this proposal. They will be treated as any other IGated raw packet. For planning purposes, such packets will be either FROM or VIA the calls of PCSAT-11 or PCSAT-12.

de WB4APR@amsat.org, Bob

On 8/3/01 3:18 PM Jeff King (transit_man@hotmail.com) wrote:

>>But you see, this is exactly the problem. There needs to be the 99% guy.
>
>WHY DOES THERE NEED TO BE A 99% guy? Tell me, I'd like to know. And
>HOW DO YOU KNOW, I WOULDN'T HAVE BEEN THAT 99% GUY? Are you so arrogant
>that you actually believe this stuff?
>

Yes, I actually believe it, though I don't think it is arrogant to do so.
There has to be a 99% guy. Maybe the number isn't always 99%, but it is
almost always greater than 50%. And that 99%, or 51%, or whatever need
not be measurable in lines of code or documentation, but if not, it is
there in terms of vision, drive and management. 99%, or even 51%, of
Linux isn't written by Linus, but he provides the vision and management
that makes it happen.

The size of the project determines whether what is needed is a guy to do
the grunt work or the management. In a small project, like findu.com,
most efficient is a code guy. In a huge project, like Apache or Linux,
you need a management guy (or in either case a very small group that are
able to function as an individual).

How do I know you aren't the 99% guy? That's so obvious I can't believe
you would ask. You are so busy trying to belittle the efforts of others
and cause general discontent, that you could not possibly do 99% of even
the most trivial APRS project. As proof, I offer the following list of
your contributions to APRS over the last 4 years (feel free to correct
all those things I missed):

-----Begin List-----

1% of the APRS IS spec
-----End List-----

This list isn't almost empty because you are incapable of contributing. On the contrary, it is obvious you are a very intelligent and skilled engineer. It is empty because for whatever reason you choose not to contribute. What is that reason? Wouldn't it be more fun to create something useful than to knock other people all the time?

>Fact of that matter is, I was looking for some feedback, of which I got
>none. I even privately e-mailed you, no response. This is no way for TAPR
>to treat volunteers, be they "99% guys" or "1% guys". Every little bit
>helps.

>

As I expalined to you, I didn't comment because there was no work expressed there. There was nothing new, no original thought or effort. I'd contrast that to the work of Ian, where he synthesized large amounts of material into wonderfully written, understandable, attractively formatted prose. He dug into the spec, wrote programs to understand how the parsing would work, found errors, and generally ran the whole show. To imtimidate that you are to the APRS IS spec what Ian was the the APRS spec is lunacy! I can't believe you would be so vain as to even hint at that!!!!

>

>>Ian was that guy for the APRS spec, and so far there is no one for that
>>job with the APRS IS spec. So you do 1% of the job (a number you admit
>>is realistic) and then you start flaming others for not doing the 99%!

>

>Another "I'm Steve and if I say it, it must be true". Who am I flaming
>prior to this message?

>

No,

On 8/3/01 2:22 PM Jeff King (jeff@aerodata.net) wrote:

>

>I'm really tired of hearing this broken record from you and TAPR how no-one
>volunteers or does anything. It is complete BS.

You are flaming TAPR and Bob for not doing the 99%, It is not complete BS. Many people are glad to contribute ideas, offers of help, and 1% of the work. However, when it come down to the nitty-gritty work, no one does it. Ian was a wonderful exception to that, as are a number of other people on this list. However neither you, myself, the APRS WG, or anyone else is able to assign tasks to these very few doers. They all have their own lives and priorities, and every right to do those things, and only those things, that interest them.

There many more people on this list that could be doers, but for whatever reason chose not to. That is the single thing about APRS I'd most like to change. We have an enormous number of talented and competent people that could contribute, but for whatever reasons never do. A few not only don't contribute, but seem to take pride in dragging down the work of others, this is the greatest drag of all.

I believe Bob when he says the APRS WG would consider the APRS IS spec were someone to do it. Certainly if someone were to do it, I'd do everything in my power as a TAPR board member and leader in the APRS community to make sure it got approval, or had whatever modifications were necessary to assure its approval.

>I simply stated, if the WG still exists, then
>amendments to the spec should go through it, and prior proposals should
>be considered on a first come first server basis.

This was not a proposal to the APRS WG. That you and I saw it is proof of that. This was something Bob proposed publicly because he felt it was a priority issue. To be honest, I don't see the need, but instead of debating the proposal on its merits or lack thereof, you chose to attempt to use it as a soapbox to show how no one else wants to follow up and do the 99% of the job you just barely started.

>
>"And obviously neither are you"? You really are arrogant, aren't you?
>I wrote a rough outline.... who is to say I wouldn't have continued on
>it if I got some feedback, any feedback. And I certainly still could,
>I'd just like a little feedback. I'm sure Ian didn't work in a vacuum
>and whoever writes the APRSSERVE spec shouldn't be expected to either.
>

Actually, Ian did work largely in a vacuum. That he did 99% of the work is really not much of an exaggeration. If he stopped because he wasn't getting feedback, the spec would be about three pages long, not the wonderful 100+ pages we have now. That's why I know you aren't the 99% guy for this project. If you were, you'd be writing now instead of complaining that no one gave you feedback!

>Read what I post, not what you think I am thinking. It would go a long
>way into stopping these Elvis and the Aliens type responses.

>
Elvis is dead, and there are no aliens. Get over it!

On Fri, 3 Aug 2001, Jeff King wrote:

> I don't trust the WG even exists or cares anymore. Maybe it is just me,

Yes, it is just you. And frankly, since 96% of all traffic on the APRSSPEC list is just your continued rehashing of your continuing complaints, probably most everyone else just ignores 100% of the postings. They have lives to live.

Thus, we cannot get anything done here when each technical posting results in a week of drivell and dozens of useless rehashing of your endless barnburning... Take this recent SATGATE proposal. I count ONE technical feed back and 21 Emails about your bitching. That is why nothing gets done here. No one wants to sort through all your BS to find the point at hand.

> but you have to admit, no official action has occured over a year.

Sorry, we may not have done what YOU wanted, but we accomplished

quite a lot. Just a quick scan of the log and we did several things:

- 1) Resolved the use of NOGATE, RFONLY and other OPT-OUT mechanisms
- 2) Resolved how Mic-E packets should be passed through the internet
- 3) Approved the /E=XXXX expiration extension to OBJECTS
- 4) Issued a revised DESTINATION TOCALL list
- 5) Began a listing of USER DEFINED FORMATS
- 6) Endorsed an APRSSPEC users attempt to draft an IGate SPEC
- 7) Resolved the need for fixed position "g" or "t" in WX reports.
- 8) Read through hundreds of rantings and ravings by Jeff

> you expect a person, on faith, to invest 1000 hours of there time when
> the WG may just be a black hole?

I agree, most of your rantings and ravings go in the black-hole. They are mostly of no technical merrit, just constant complaining about how you want everyone else to do the work.. Each of the members of the WG has invested not 1000 hours but more like 8,000 hours or more...

> >We don't complain. You are the only one that complains. We simply state

> presented the fully polished document. Come on, that is not how a
> protocol process works.

YOU ARE RIGHT. THAT IS NOT HOW IT WORKS. Ian was given my COMPLETE APRSdos PROTOCOL documents and from that he edited it into the SPEC format. EVERYTHING WAS THERE. He EDITED it and pointed out any conflicts or errors and the WG worked to resolve those into a final document. But 99% of the protocol WAS DOCUMENTED BEFORE the SPEC WORK even began.

Now, as we say over and over and over and over again to you JEFF, there is no draft IGate SPEC. And no matter how much you complain, there is no SPEC for the APRS WG to review nor approve until SOMEONE prepares a complete draft and submits it for review.

de WB4APR@amsat.org, Bob

A possible issue... If using APRStk or future equivalent with
a D7/D700 to monitor for packets - we'd need software a bit
smarter so it could switch the outgoing ALIAS and the local
SSID on the Igate at the same time the frequency was switched.

Not a big thing, just something that will make it more
interesting.

> Thus, I suggest SYSOPS use the following SSID defaults
> for their SATGATE callisigns:

>
> YOURCALL-1 1200 baud on 145.825 (PCsat-1 operates there)
> YOURCALL-2 9600 baud on 145.825 (PCsat-2 operates there)
> YOURCALL-5 9600 baud on 435.120 (UOSAT5 operates there)
> YOURCALL-7 1200 baud on 437.100 (SAPPHIRE operates there)
> YOURCALL-12 9600 baud on 144.39 (PCsat can operate there)*
> YOURCALL-15 1200 baud on 145.800 (ISS operates there)

And as for the multiple * on heard digi's, the Linux AX25 listen
function shows them that way. I don't think it has any bearing
hear as what's being discussed is how they get sent to the Igates
which is a different process.

I notice you have yet to address what started this. That is, the
protocol process.

Steve Dimse wrote:

> Yes, I actually believe it, though I don't think it is arrogant to do so.
> There has to be a 99% guy. Maybe the number isn't always 99%, but it is
> almost always greater than 50%.

First of all, once again, you take things out of context. This "1% figure" you keep citing was the first step in the process in any contributory tech writing endeavor. This is no different then collaborative groups in industry do it. A draft outline that was sent directly to you for a reality check that you REFUSED to even comment on. The fact that the founder of APRSSERVE refused to comment on it, just like you continuing unfounded attacks on me, was discouraging. And in any case, 99% and 50% are not the same number.

As to arrogant, I was referring to your general attitude which has been formed over the years, and recently reinforced today in private e-mail when you made some discouraging remarks about another party here. Just your general demeanor... actually I think it is part of your education, I've noticed it among other ER doctors I have known over the years. You might want to leave that at the door.

> And that 99%, or 51%, or whatever need

What vision in APRS are we referring to?

> The size of the project determines whether what is needed is a guy to do
> the grunt work or the management. In a small project, like findu.com,
> most efficient is a code guy. In a huge project, like Apache or Linux,

> able to function as an individual).

Yet we are talking about a formal protocol process, a far cry from your closed source project FINDU. Protocol development, in particular now, needs to be an open process, one where the "1% guys" you are so fond of belittling can contribute.

> How do I know you aren't the 99% guy? That's so obvious I can't believe
> you would ask. You are so busy trying to belittle the efforts of others
> and cause general discontent, that you could not possibly do 99% of even
> the most trivial APRS project.

Lets see, how do I say you are full of it a nice way? Can't think of a way to do it. All I stated here was that there were prior proposals on the table for protocol additions that should be addressed also, if the process still exists or is open. Why do you have such a problem with the obvious and why do you equate stating the obvious to "belittling the efforts of others"? You make all these statements you can't back-up...

> As proof, I offer the following list of
> your contributions to APRS over the last 4 years (feel free to correct
> all those things I missed):
>
> -----Begin List-----
> 1% of the APRS IS spec
> -----End List-----

Well, besides being arrogant, you also are dishonest as well. Suprise suprise... now the question is should I even bother to counter your claims? Oh, why not, I'm sure you'll be able to find some fault with them as well, I trust you Steve to only see what you want to see and do your best to minimize and degrade the contributions of others.

> something useful than to knock other people all the time?

Again, you have come to a conclusion that the facts don't entirely support. Your seeing something, or misunderstanding something, that is just not there. I will admit to being less the tactful far to often, but the message is stays the same. Since you are again making a accusation, who am I knocking over? I think you are confusing the expectation of ethical behavior with knocking people down. Maybe a fine line, but it is a line. If one accepts the responsibility of administering a standards group, a group the can exert influence on both the individual and industry, one should expect ethical behavior. Allowing insiders proposals to be heard and accepted while outsiders protocol amendments remain tabled, seems unethical

to me.

Now, was I accusing someone of purposeful unethical behavior? No, not at all. I just was pointing out the appearance of unethical behavior. It is a fine line, and bottom line, someone has to care. From what I have seen, the appearance of ethics within certain groups is not a high priority.

>

Another attaboy for Jeff, huh? Maybe TAPR should appoint you as the new volunteer recruiter?

And what was "not new" or "not original" about these points I raised?

from <http://www.tapr.org/tapr/list-archive/aprsspec/0102/msg00024.html>
**Extensions to messaging
 RF message gateway selection
 Least hop routing
 Least power routing

Who, besides me, in a public forum, have you ever heard discuss least power routing in the context of APRS? And for that matter, even routing? BTW, Bill Diaz suggested I remove the extensions as he felt just get the basics first. I agreed with him, yet there it is out in the open.

As I said, you see what you want to see.

> To intimidate that you are to the APRS IS spec what Ian was the the APRS
> spec is lunacy! I can't believe you would be so vain as to even hint at

>
> You are flaming TAPR and Bob for not doing the 99%, It is not complete
> BS.

Then cite what I am saying, otherwise it is yet another Stevism. AGAIN, for the challenged, I am saying it is improper to move ahead with additions to the spec unless the tabled additions are also addressed. Real simple but one has to have some understanding of ethics to grasp that. Possibly this is the common ground we lack.

> I believe Bob when he says the APRS WG would consider the APRS IS spec
> were someone to do it.

So, by your estimates, someone will invest 1000 hours in the spec, in a vacuum, with no feedback from the major players, and then the WG will consider it? Thanks, but I'll pass on that one. I need feedback that I am on the right track.

> >I simply stated, if the WG still exists, then
> >amendments to the spec should go through it, and prior proposals should
> >be considered on a first come first server basis.
>
> This was not a proposal to the APRS WG. That you and I saw it is proof of
> that.

That you and I saw it is proof? I don't understand that statement. The amendments I saw that were proposed to the working group, and then tabled, were also posted here. The thing you DON'T understand, that if you going to have a spec, you need to have a process FOR that spec. It is a black and white issue. It either is, or it isn't. It can't change depending on who is proposing something nor should it be excused. It is a fundamental issue.

> This was something Bob proposed publicly because he felt it was a
> priority issue. To be honest, I don't see the need, but instead of
> debating the proposal on its merits or lack thereof, you chose to attempt
> to use it as a soapbox to show how no one else wants to follow up and do
> the 99% of the job you just barely started.

Again, here we go with the Stevisms again. Your the one doing this 99% of nothing argument. Again, for the challenged, this is what I was saying:

I am saying it is improper to move ahead with additions to the spec unless the tabled additions are also addressed.

> >Read what I post, not what you think I am thinking. It would go a long
> >way into stopping these Elvis and the Aliens type responses.
> >
> Elvis is dead, and there are no aliens. Get over it!

OK, gladly, is there a medical diagnose for only seeing what you want to see? This discussion had nothing to do with Ian, APRS internet, 99% of nothing or power poles. It had everything to do with a process, and applying that process in a fair and equitable manner. All I have hear here are excuses and attempts to divert the issue.

And all I am guilty of is pointing out the obvious. I'm sorry it hurts, but no matter how much you attack and belittle my accomplishments, I'm not going to back down. Ethics and the appearance of ethics do matter in a volunteer organization.

Really? I've seen more then few say the same things here. Certainly the lack of any activity or effort to replace the missing members makes it seem that way.

> And frankly, since 96% of all traffic on the
> APRSSPEC list is just your continued rehashing of your continuing

96% of all traffic? Care to document that claim?

BTW, some people do take ethic's concerns (or complaints as you put it) seriously.

> Thus, we cannot get anything done here when each technical posting results

You really don't understand ethics do you? You have two votes on the WG, more then any single member. People who were NOT members of the working group have made similar amendment proposals in the past as you are now. There proposals were tabled for a latter time.

All I am suggesting is if it is good for the goose, it is good for the gander. If you want your amendment considered, it is only fair and equitable that all the tabled amendments be considered.

Why is this so hard to understand for you?

What I wanted? Actually, I was one of the big proponents of the "NOGATE"
spec, so I guess I owe you some thanks. Where in the spec does it say this?

> 8) Read through hundreds of rantings and ravings by Jeff

Glad to be of service to you.

Buzz light year, to infinite and beyond! So, let's see 10 members times
8000 hours = 80,000 man hours. Are you sure you might not be over estimating?

GOOD, now tell that to Steve. That is exactly what I meant. Ian had some
kind of basis to work with, I start to assemble a basis to work with
(Steve's 1% argument) and I am ignored/attacked over it by a principle.

> Now, as we say over and over and over and over again to you JEFF, there is

> complete draft and submits it for review.

I don't disagree with this statement, I'm just suggesting whoever does this, you/Steve/whoever give some feedback to while they work on it. For the volunteer organization challenged, this is called positive feedback. As you point out, the APRSINET documentation, what little exists, is disjointed and not coherent. Whoever takes this task on is at a distinct disadvantage as compared to the drafters of the APRSSPEC document. Your documentation going into that process was fairly complete.

You may want to reexam your volunteer requirements for APRSINET writer. I don't see how a coherent document can be developed in a vacuum. Some feedback will be required.

Thanks Allan. It is good to see some clear focused thinking here suggesting a solution.

This really is a black and white issue. It either is, or it isn't. The excuses that this was not a formal proposal to the WG don't hold any water because the person making the proposal is the anchor (with 2 votes) of the WG. As such, lack of understanding of the process is not the issue. It either is, or it isn't.

> What's good for one should be good for all...

Advice well said.

Missed a few insults earlier so now catching up. For the ones that don't know what a delete key is, just think of me as the nasty poodle on the WG's leg.

What is "Tabloid misinformation" about this?

Seems like a fair proposal to me. Why do you a issue with playing fair in the sandbox?

Truth be told, I can't find NOGATE or RFONLY in the spec document. Did the APRSwg adopt it officially? On the other hand, RFONLY (along with [GR##ID]-in-comment) has been part of the BEACONet protocol for quite some time.

I would be suprised to find that it had been included, since I was an initial proposer of the alias, and hadn't had the opportunity to review how the function was documented so as to correctly describe it's personality should the APRS world wish to include it as a compatible alias.

Of course, several software authors have thankfully chosen to include this non-APRS yet BEACONet-friendly function in their product and have enjoyed the free advertising that comes along with having done so for the BEACONet community. Example: UI-View was featured in the May 2001 QST article. AHub will probably be placed in operation within the next 60-days as a BEACONet Internet system, and will probably be featured in future articles written about BEACONet, too. fwiw.

As succinctly as I can put it...

- o Bob proposed an addition to the APRS(tm) Protocol Specification
- o Jeff asked about the process for official sanctioning of an APRS(tm) protocol addition/modification
 - See APRS Protocol Working Group Charter
 - = Section II, item 5

Yet, APRS(tm) Working Group Charter (available for viewing at: <http://www.tapr.org/tapr/html/Faprswg.html>), Section V spells the APRS(tm) Protocol proposal-process out pretty well -- leaving little to the imagination.

The first question is... (to the APRS wg): would someone point us to the website where the proposals are posted (APRSwg Charter, Section V, "Committee Operations and Community Input", Item 1)? There, we should see things like the RFONLY/NOGATE proposal, maybe?

That should go a long way to settle alot of misunderstanding and misinformation. Thanks, guys!

I certainly respect your opinion Wes... also Bob's and Steve's... and mine is that I think Jeff has some valid points... like a now retired good Boss told me... ignore the tone of how the message is delivered... pay attention to the actual content... a frustrated customer cannot help but have a poor attitude and tone of voice... but in all likelihood there is good information in their lament... focus on the content of the message and how that will improve the product not on the tone and attitude of the delivery - then we will be able to deliver better service to all eventually.

I'm on a we should thank the US Department of Defense more often kick today... pardon my editorial.

Yes, Bob started GPS packets over RF for ham radio... (though the Military did the same before APRS) and we have him to thank for bringing this to Ham radio... and Steve has made the same information readily available via internet connectivity (which also came from the Military)... they did what they did (both significant and painful efforts) - not by a formalized process and committee - but by individual efforts... kudo's to them both because these efforts were NOT Trivial... and they've both taken heat from complainers and do-nothings - ever since.... I'm sure they are tired of it... However, I have to admit Jeff has valid points... having been part of some non hobby - military and industry efforts - it has been my experience that there are leaders who talk a lot (and shape the direction of the effort)... but they are but no means the most significant contributor... just the most visible one... that group efforts are in fact the rule, and

that many significant contributions really have been made by time limited individuals... but more to the point... that the formal review and approval process - which built the internet by the way - has time and again made a significant difference to the benefit of all in the end. I wish I had a dime for every attempt I've dealt with on the part of a vendor... to make proprietary extensions to a standard.... and I am so thankful for the review process (as Ian did) as it was a way to catch those (and other) issues before they became bigger problems.

So, as I understand Jeff's comments - I think he has a valid point - - - that the process for APRS protocol additions and changes should be equitable - that other proposals have been made here and not considered... and that there's some question about the continued viable existence of the working group. I ignore the rest (because I am very interested in the answers to those three questions).

I may be wrong, but I think Jeff's question raised a good point... if we are going to consider Bob's extensions (and there is a short time to bring that in line due to the upcoming launches) - then that was a clue that the working group was considering extensions and changes... so let's get those others on the table - and that a announcement of these extensions is also appropriate. After all, we were told here in the past that no additions or extensions were being entertained by the working group until the initial spec was captured... and since the SPEC was "published" - proposals have been ignored or publicly slammed here on the SIG as non-compatible.... well I for one would like the working group to please re-state here on the spec discussion list... what the process is for proposing additions to the spec - and who gets to review them - who determines they are blessed? and what is the priority for review? and.. oh by the way... (I can take a hint... but I have to ask) are extensions and modifications even being accepted at all yet - because I never saw an announcement of such - not that there was a requirement... but courtesy would have made it nice. Do I just throw them out on this list again??? Then what will be the process for review and inclusion... just Bob saying yes or the WG getting together behind closed doors? (I'm being sarcastic - not serious I hope)...

Yes Wes... I too see rather "emotional" and inflammatory statements being made... but they are coming from all parties... statements that seem to be more in the vein of a personal attack rather than provide useful content.... and personal attacks stated in a way to appear as questions... does not make them any less of an attack... But this SPEC discussion list was started to get spec "discussions" off the primary SIG list... so I'm hoping to hear more about the formal process ... and I'm willing to ignore the frustrating tone of the messages... in hopes of learning something... and maybe ultimately finding out how the process is going to work for extensions and modifications... and to hear how the Working Group (which was exclusionary when it was established) is going forward... on Bob's proposal... and hopefully some from other lesser individuals (sarcasm again) !!?!?!?

Keep'm coming is what I say... just tone down the personal attacks... I learn from most of this commentary so let's make some progress here and get some answers - rather than deflecting the questions with personal attacks!!!

>others on the table -

The point which seems to have gotten lost in the noise is that Bob's proposal had absolutely nothing to do with the APRS spec or the APRS WG.

The APRS Internet System is not documented or managed by the APRS WG. Should it be? Yes, but it is not because there is no one to do the grunt work of writing the spec. Jeff tried to make that TAPR and the APRS WG's fault, because he began the process but no one stepped forward to help him. Then he calls me arrogant because I tell the truth, that there must be a single person willing to lead the effort, and there presently is no person to be the Ian of the APRS IS spec. Jeff would have you believe that he is the guy that can lead a project full of open source documenters, but if that were the case, it would be happening now, and Jeff would have nothing to complain about, or at least he'd be too busy to do so.

So, with the APRS WG unable to make any changes in the APRS Internet System, Bob took his proposal to this list, hoping to get the individuals that write APRS IS software to make the changes. This does not signal that the APRS WG is considering any changes to the APRS spec, any more than if Bob adds a feature to his program it means it is endorsed by the APRS WG. We all have many different roles, everything Bob says doesn't involve the APRS WG, everything I say doesn't involve my role as a board member of TAPR. To me, it is pretty clear which hat I'm wearing at any given time, but I can see how it might be confusing to others, and in the future I will try to make such things clearer, perhaps Bob will do so as well in order to avoid future misunderstandings.

I SAY AGAIN. I AM NOT PROPOSING ANY EXTENSIONS TO THE APRS SPEC!

LET ME BE PERFECTLY CLEAR:

WHAT I ASKED FOR WAS A WAY TO IDENTIFY SATELITE PACKETS THAT WOULD WORK
WITHIN THE EXISTING IGATE SYSTEM.

READ MY LIPS: "WITHIN THE EXISTING IGATE SYSTEM"

THUS I AM NOT PRPOSING ANY "EXTENSIONS" or "ADDITIONS". To do such would
be ludicrous in this environment and it would never happen due to the
process you have just witnessed.

WRONG. I MADE NO SUCH PROPOSAL. I AM INVOLVED IN A LAUNCH OF A
SATLLELLITE THAT WE MUST DELIVER IN 3 DAYS, AND LAUNCH IN 3 WEEKS.
I SIMPLY MADE A POST TO *ANYONE INTERESTED* IN WHAT I NEEDED ON THE GROUND
TO SUPPORT THE IGATING OF THE SATELLITE DATA INTO THE APRS SYSTEM.

FORGET I EVER POSTED IT ON THE APRSSPEC LIST.

THIS IS NOT AN IGATE SPEC PROPOSAL,
IT IS NOT A SUGGESTION FOR AN ADDITION TO THE APRSSPEC.

If AUTHORS want to work towards helping with this project, I put the
requirement out in the public domain. If anyone wants to contribute,
please do. If all you want to do is quibble about proceess, leave me
alone. I have too much else to worry about right now..

I'm suggesting we fall back, and give Bob a break on this for the next month.

I've been where he is now in the delivery schedule for Flight. I suggest he doesn't need any extraneous distractions, discussions, etc until his bird is on orbit.

I think we all have enough food for thought to work from, and I'd ask that we table the discussion until 15 SEP 2001, to let Bob get past delivery, launch, and well into on-orbit checkout.

Bob, good luck with the flight. We're rooting for you.

73, gerry n5jxs

/reaction to all-caps reply/ I simply restated what I heard people saying, Bob. No attack was intended -- though your frustration was difficult to overlook :o). Interestingly, your response forced further research on my part, which is a good read for anyone interested.

Bob is **absoultyly** correct in his message. I had to go back to the

original posting and re-read it carefully to understand that, though.

His proposal has **nothing** to do with the APRS(tm) Protocol Specification.

By definition, the APRS(tm) Protocol Specification deals only with RF issues.

By definition, the SGate function (if I can coin a phrase) that Bob had floated takes place **after** the frame has been received by SGate/IGate station, and **before** the frame is passed through it's IGate port...with the Internet as its destination. No RF is involved. Bob is not proposing that a new "digipeater alias" be established that RF stations would insert into their transmit frame. All of the processing that is proposed takes place after the frame is no longer RF in nature. Therefore, it is not an APRS(tm) Working Group issue (by it's own statement of purpose).

This is not unlike the development that Steve undertook in establishing an Internet Protocol. Bob was simply posting it for public scrutiny (not approval) so that wrinkles could be worked out of it (and at least one has, by the way).

By the way...there are those that would see this differently:
"> THIS IS NOT AN IGATE SPEC PROPOSAL,". Yet, that doesn't change anything as there is no sanctioning body established to regulate that either.

Have at it, Bob and crew. This is an interesting thread (when kept on topic <smile>). Please keep the thread on this list, though. I'm here to learn from reading the mail.

I can hardly wait to start flooding your new satellite with 24/7/365 beacons with high power and a tracking antenna. <you KNOW that i'm just kidding, don't you?> :o) Best wishes in your new endeavor.

Ev, W2EV

We can't really do that Bob was bringing up his proposal because he
needs it right away when the bird gets up.

Yes, and the discussion had nothing to do with the specific's of Bob's proposal, just the mechanism that the WG has in place (or not) to allow additions to the protocol. There is no reason this cannot be done in parrall.

Ev:

(Bob, skip to the part that says "-- A possible solution --")

Ev Tupis wrote:

> By definition, the APRS(tm) Protocol Specification deals only with RF
> issues.

The charter doc does say this in certain places, it also doesn't say this in certain places. You might want to review it again, since you were in fact that one that got me looking at it, and in fact pointed out some glaring holes.

Also, SSID's are a AX.25 protocol issue. By definition, AX.25 is a over the air protocol. They might be applied different, but this does make the whole issue muddy and is a justification for bringing these hard questions up.

In any case, my concern, one of your claimed concerns, and also Allen's had less to do with the semantics here of the document and more to do with just what is morally right. People have had amendments on the table for some time. The fact that I brought this up is not to impede or imply in any way Bob's wasn't needed, just that other people deserve to know what is going on with their hard work.

I'm seeing alot of people using parts of the WG charter to declare moral victory here. Problem with that is, what about the rest of the charter, as you yourself pointed out. Why should we use parts of it as defenses for out actions while ignoring other parts altogether? It either is, or it isn't. Why is this such a hard concept for some to grasp?

Nobody gets it, or they would rather call names, but it really is a black and

white issue. People are more concerned about being right then fixing the problem. The WG, in its current state of limbo, is a impediment to progress. How many new additions to the over the air protocol had we had in the time since May of 1999 vs the same time period before May of 1999? Before others (not you Ev) are going to start calling names, answer that simple question.

And Ev, do you think the APRS over the air spec, in its current shape, answers all you needs? Answer this question please.

The fact that Bob is the anchor member of the WG (2 votes) is the reason I brought this up, as it best showed the inequities of the process. We CANNOT address, or use, one part of the charter as a defense to our actions while completely ignoring other parts of it. To be taken serious, it HAS TO BE a black and white issue.

-- A possible solution --

Now, we discussed off line ways to solve this. I really don't think we should simply drop this because it hurts our fingers to type it. You know and I know it will keep coming up again. I think we agreed that the present status of the WG is one of three things:

The WG still exists, but is inactive
The WG has been disbanded
Or nobody knows.

The end result of all this is a state of limbo, which quite frankly is WORSE then what we had before the WG existed.

So, how do we solve this? We know in any scenario, Bob has to be a central part of the process. But we can't let the process get caught up in the muck of indecision that it is now. This only hurts progress.

As I suggested to you in private e-mail, one solution would be to recognize Bob as a benevolent dictator of APRS, aka Linux Tovalds. This is a *good* term, and does not imply complete control. It just implies, per the Linux model, a guiding hand in the progress of the system.

Specifically, what I suggested to you had two OR trigger points. If something is

to be
added to the protocol stack is requires one of two things:

1. Bob thinks it is a good thing to add
- OR
2. Someone else has run it through the peer review session and gotten a GUI/end user application to support it.

So, in other words, you either need to convince Bob of the worth of the addition, or get community support of the addition. In the case, the community really does mean just that, it would be open to membership of all that were interested and would contribute.

Now, to manage this process, as I mentioned also to you, you could use such open source management tools as source forge. See <http://www.sourceforge.com> The nice thing about this process is that it does allow us that only have a occasional 5 or 10 hour a week block to devote to this to actively contribute useful stuff. Gone are the days (or it should be) that APRS is the exclusive domain of those that can devote 1000's of hours to writing GUI applications, those of us that can contribute less, but still valuable things, should also be allowed to participate. Most of the real world recognizes this, yet I fully agree we need a champion.

A couple people on the SIG have already spoken up thinking the source forge idea for the APRSSPEC is a good idea, in past postings I have made. I won't name their names due to this firefight, but I'd like those that have taken the time to go this far in the message to say if they feel it is a good idea, or a bad idea, in the context of moving things forward. Please, no private E-mail saying good idea, it is going to take some grassroots effort to make this happen.

-- Bob -- (and also see above)

Bob, if you think this is a good idea, I think all you really need is some grassroots support. As someone pointed out to me in private E-mail (the legal definitions of

the
termage used in the WG charter), this language only applies to corporations. Since
the
WG never incorporated, there is nothing stopping you from doing this, although I
think
the principles of the WG should be a part of any new charter, or simply remain the
same.
Maybe it is as simply as just changing the comment process.

Anyways, lets here what you think, and move forward. In the affirmative, I'll
research the
sourceforge docs more and help you set it up (or there are others here that can
help if
you would rather me stay out of the process..... I understand).

I just hate limbo.

73

It seems unlikely that we're going to definitively resolve anything in the remaining time. So, let's do this launch like Bob suggests and then continue in a less time-constrained fashion to achieve consensus.

Then specifically document your claims, otherwise apologize for your continued dishonesty and personal attacks towards me.

> Then he calls me arrogant because I tell the truth, that there must
> be a single person willing to lead the effort, and there presently is no
> person to be the Ian of the APRS IS spec.

I call you arrogant because you were acting this way. Hey, even Bob disageed with your statement above, yet you keep making it a "Jeff" issue. Again, and parroting Bob's words, the APRSINET spec does not exist/is a mess. The APRSSPEC

DID exist pre Ian and this is what Ian worked off of. This is a completely different

animal and the APRSINET SPEC has to be approached in a cooperative way, at least until all the spec data is gather from all the papers, source codes and random postings

you have made over the years. Bob did a very good job documenting the APRS over the air spec, you did not. No cut on you, but if you don't believe me, take a look at some of his pre WG APRSDOS releases. Just stating a fact, and this fact makes a difference how we approach the task.

But that is not in any way to lessen the technical writing and verification efforts

of Ian, but we are still a long way from a technical writing exercise. My source forge

suggestion may be a even better fit for the APRSINET spec.

> Jeff would have you believe
> that he is the guy that can lead a project full of open source
> documenters, but if that were the case, it would be happening now, and
> Jeff would have nothing to complain about, or at least he'd be too busy
> to do so.

No, not all all. I simply stated it was discouraging that the author of APRSSERVE, when repeatedly asked to comment on a rough draft outline, refused to do so. This person was you. That is all. You have no obligation to do this, but it was just discouraging. You are a different person then Bob. And that is not to say I won't start back up, but in a volunteer group, it is wise to give some positive reenforcement occasionally.

In any case, read what I say, not what you want to hear.

> We all have many different roles, everything Bob says doesn't
> involve the APRS WG, everything I say doesn't involve my role as a board
> member of TAPR.

Ahhh.... the Clinton defense. Well, to some degree you are right, but it just seemed a good time to bring this issue to the forefront when the anchor member of the WG was proposing additions to the spec when others additions have been tabled for more then a year. Don't you see the irony in this, even if it was not intentional?

The thing I really don't understand, is in private e-mail to me you have repeatedly shared your views that the APRS-WG is dead/canatonic and will not move forward. Yet here you are time and time again publicly excusing the inaction's. That is fine, but I am more interested in a solution, then a excuse. Lets stop throw darts at each other and talk progress. And who knows, maybe one of those 1%'ers might make a difference.

-Jeff

Gerry:

I think the only one standing in your way is yourself. Resolve the technical issues. But DON'T connect the ethical and technical issues and say progress cannot happen. And by the same token, don't glibly dismiss the ethical issues.

I think it is time someone stood up to the bullies, and resolve this issue. It is too bad many can only do it in private e-mail, but I do commend the few that have been able to do it in public.

The APRS-WG is broke. It needs to be fixed, or it needs to declare victory, disband and allow another mechanism to come into place. There are no gray areas here. It is a black and white issue. You know this.

Then if we do nothing, it is only our own fault.

Jeff, there has been no dishonesty on my part, nor do I think on your part. The first personal attack in this thread came from you. Anyone on this list has gotten all the posts, I see no need to quote the specific sections where you accuse TAPR, Bob, the APRS WG, and myself of failing to complete the task you barely started.

I also see no need to continue trying to tit-for-tat you. I leave it to all on this list to decide which of us to place their trust behind.

>And who knows, maybe one of those 1%'ers might
>make a difference.

>

I guess we just have a difference of opinion there. Absolutely there are 1%'ers out there that will make a difference, I was one once, so were the Sprouls, and all the rest, and we all made differences. Where we differ is I say the difference will not be made while they remain 1%'ers. Bob isn't a 1%'er, nor are the Sprouls, Frank, Byon, Brent, Mike, Rob, myself, or any of the others that created the APRS of today. Some people, for whatever reason, step forward and make an individual effort that changes things.

Maybe your highest aspiration is to be a 1%'er, but I aim higher. Perhaps that's why I achieve more.

Steve K4HG

> Or nobody knows.

Jeff,

How many times do we have to go through this. The above is absolutely wrong and misleading to everyone. And who are the "we" that "agrees" to the above? Let me say it over and over again.

The WG exists. The RF Spec version 1.0 is complete. We are now ready to review and discuss a draft specification for the Internet portion of APRS. We need someone to document the IGate Specification so that there is something to review.

We need someone with the time, experience, and knowledge to draft the spec for review. In the volunteer world of amateur radio, harping about others never accomplishes anything. Until someone steps forward with the time, experience, knowledge and desire to draft the spec, we have nothing to review and "approve".

SPeaking for my self as a member of the WG, I will not be favorable to any significant changes to the APRS spec until I see the Internet side of

things documented so we have a clear idea of where we are starting from. In case you have not noticed, I would say that the INTERNET side of APRS has continued and will continue to be the LARGER piece of the APRS pie.

Right now there is nothing on paper to review. No one knows how the Internet side of APRS works except for the pieces of code in about 10 authors software. And we have no guarantee that any of it works together.

I say again, until we document what we have, I am (as you say) opposed to getting all wrapped around the axle with changes to something we cannot see. When the WG was first formed, the 1st thing on the agenda was to document the RF spec. The 2nd thing was the IGate spec. We are still on that schedule.

de WB4APR, Bob

But that is exactly the point I was mentioning. You are so concerned about being right you are loosing focus of the fact the APRS-WG is broken and have carefully avoiding in any of these postings talking about it. Hey, I already know I am blacklisted in some of the groups here, that goes without saying. So I am more then happy to fall on my sword if we can get some progress in something that does make a difference to me.

I don't want tit-for-dat, just progress. Address your thoughts on this.

> >And who knows, maybe one of those 1%'ers might

> Sprouls, and all the rest, and we all made differences.

Yes you where. I was a "1%'er" in the TAPR SS process once, and then went far beyond that becoming very actively involved in the STA testing. Yet what we have in common here is that we were both involved at the beginning of the process, aprs in your case, SS in mine. By 1%'er, I am referring to someone that enters a process that is more mature.

> Where we differ
> is I say the difference will not be made while they remain 1%'ers. Bob

Right.

> Maybe your highest aspiration is to be a 1%'er, but I aim higher. Perhaps
> that's why I achieve more.

Can you explain the above to me? You claim not to be making personal attacks, and as you know I have been far far more then a 1%'er in certain areas of

APRS and other areas, so I can't see how the above can be yet another dishonest personal attack. Now, I don't beat my chest as much as you, nor target my activities

to attack the most attention to myself, but I am far far more then a 1%'er and you know this. I only agreed with you the effort I started on the INET draft was only 1%, and you know this.

Or don't you have enough personal integrity to address this direct question to you?

-Jeff

What is wrong? You had three choices:

1. The WG still exists, but is inactive
2. The WG has been disbanded
3. Nobody knows.

> And who are the "we" that "agrees" to the above?

Well.....

John Ackermann N8UR, a member of the WG, wrote on 8/3/01:

(with regards to Bob's proposal)

> I can assure you that the WG is not working on
> this, or frankly any other, proposal.
>
> Whether the WG is still alive or not is a good question.

So, I hope you can excuse my confusion here. As to the other "we's", well they can step forward if they want, but to be safe here I'll be a advocate of #3.

> The WG exists.

Maybe, yet you don't disagree the process is broken? I noticed you and others have carefully avoided the WG charter compliance issues that Ev and Allen pointed out.

> The RF Spec version 1.0 is complete. We are now ready to
> review and discuss a draft specification for the Internet portion of APRS.
> We need someone to document the IGate Specification so that there is

> something to review.

Yes, no doubt there, but where in the charter does it say this is the next step? I was told time and time again on this list that the internet spec encapsulates the over the air spec, hence IMHO, it seems there is room for parrall development here.

> SPEaking for my self as a member of the WG, I will not be favorable to any
> significant changes to the APRS spec until I see the Internet side of
> things doucmented so we have a clear idea of where we are starting from.

But don't you see what you are doing here? There are two distinct issues here, you keep trying to roll them into one, when they are not.

I've seen no substantive proof that the WG even exists and that the charter is being complied with. Others pointed questions to this by others have also been ignored.

> RIGht now there is nothing on paper to review. No one knows how the
> Internet side of APRS works except for the pieces of code in about 10
> authors software. And we have no guarantte that any of it works
> together.

Yeap, thanks for agreeing with me that the APRSINET process is a far cry from where the APRSSPEC process started. As such, it will require a cooperative issue, it's own WG so to say, as the information first has to be collected together before a technical writer even sees it.

But that is not the point and has nothing to do with if the present WG is broken.

> I say again, until we document what we have, I am (as you say) opposed to
> getting all wrapped around the axle with changes to something we cannot
> see.

Has a vote been taken on this? Still doesn't dismiss the need to comply with the charter, but would be good to see there is someone besides yourself willing to speak on the behalf of the WG. You know, kinda like the group still exists.

> When the WG was first formed, the 1st thing on the agenda was to
> document the RF spec. The 2nd thing was the IGate spec. We are still on
> that schedule.

Did you change the charter? Lets take a look at the charter, and see what it has to say about your claims above, in particular the work plan and assignments. One can find the charter at:

ftp://ftp.tapir.org/aprssid/aprssid/spec/announcements/APRSWG_charter.pdf

APRS-WG Charter said:

--

Page 2:

4. The Group will formalize the APRS on-air Protocol Specification and publish a definitive APRS protocol document. Present plans are to make the specification in book and diskette form, and possibly to provide it via electronic distribution.
5. A process will be put in place to define how changes to the protocol specification are made, and that process will permit input, review, and comment by the Amateur Radio public.
6. The Group will put a voluntary APRS certification process in place, to be managed by Bob Bruninga with Group oversight. The process will include a publicly available validation suite.

--

Lets take a look at this point by point:

- 4: Completed
- 5: What is this process?
6. Not complete(?)

Page 2:

The APRS Protocol Specification is the formal definition of the data elements and message formats used to communicate between APRS devices via wireless or wired (e.g., Internet) connections. It does not include user interface or other elements that do not affect the content or format of these interface components. The Protocol Committee, which presently consists of all Members, is responsible for the APRS Protocol Specification. It manages the process for publishing and updating the Specification, and for receiving public comment on proposed changes.

--

Reading this, this implies that both the over the air, and the internet side are part of the APRS Protocol Specification. Further, it seems to imply that the protocol committee is responsible for both aspects, over the air and internet. There is not a different process for each aspect. One could assume that both aspects would be handled in the same manner. I', *not* trying to suggest others do the work, I'm just trying to give you further proof the WG is broken and needs to be fixed, one

way or the other.

Page 2:

The Protocol Specification will define iMandatoryî and iOptionalî elements, and will take into account the requirements for various types of APRS-compatible products.

I don't see this anywhere in the spec, even though I and others suggested this. Again, not complaining, but this was a key part of the process, and not completing it because the INET is not done, implies the charter is "broken".

Page 3:

Committee Operations and Community Input

Input from the APRS user community, other APRS developers, and the Amateur Radio community at large is a key component of the protocol development process. To ensure

this input, the following process will be used to amend or revise the Protocol Specification:

1. Proposed revisions to the Specification may be submitted by any person, and will be published at the Group web site.

Many things were submitted, they were deferred because the protocol committee was busy working on the draft over the air protocol. Yet where on the web page are proposed changes published on the web site?

Listen Bob, most of us have known the above charter was not being complied with for some time, so it is not my purpose to crucify it. My purpose is to show you the over the air spec is incomplete, and in any case, should not be left uncompleted just because a polished draft has not been submitted on the INET protocol. It really is two different issues, and in any case, the over the air spec needs to be brought into compliance with the charter, if the

WG wants to claim it still exists.

With the above in mind, how about commenting on my suggesting of moving the WG efforts over to Source Forge. In case you lost it in the firefight, here is the URL again:

<http://www.sourceforge.org>

I suggest to everyone they think less about being right, and more about fixing a process that has gone morbid. This could mean fixing the existing group, or restructuring it in some way. The end result is what matters, not how we get there.

Sincerely,

Jeff

Don't recall drawing first blood, but fair enough. Maybe we should both pull back a little. Any thoughts on ways to fix the WG? You certainly expressed alot of derogatory opinions about the WG in personal e-mail to me. Or if you have no constructive thoughts of your own, how about tearing some holes in the possibly solutions I suggested to move forward?

> I consider you nothing but a drag on APRS, and I will do my best to make

Hey, I got a great idea. I notice you have gotten more time in the DCC APRS forum on Friday, maybe in your role as the moderator of that forum, you could have a session highlighting all evil things I have done to Steve Dimse and others to drag down APRS. Another world class thought, Steve!

What is the "business as usual" if this SIG? Talking about protocol issues
that will go into a blackhole?

FYI, a process was put in place, and this SIG was
created to assist in that process. If the process is broken, it seems in
IMHO, it either needs to be stated it is broken, or repaired.

I'm serious, what does everyone think the purpose of this SIG is?

Non-rancorous discussion of technical merits leading to
consensus-building related to the particular issues at hand.

And that's been hard this time.

Good questions have been raised by virtually every significantly active
party to this recent thread, but the noise level has also been
significant, and very distracting.

Understood, but don't you agree there has to be a formal process in place,
and if there is a formal process in place, it be followed? At best, the
process is fuzzy and even those on the inside cannot agree with each other.

> Good questions have been raised by virtually every significantly active
> party to this recent thread, but the noise level has also been
> significant, and very distracting.

Understood, and I've tried to change the thread topics in my responses, as
you earlier noticed, to try and minimize the distraction, which in any
case is intense as you noted.

This really is a case of the emperor has no clothes, and in the popular fable,
the one (or in this case, multiple parties) that noticed the emperor had no
clothes
where not well received. One would rather believe something is, that really isn't
because
of the fear of public condemnation.

I would suggest to you and others involved, that you focus your technical
discussions
on the task at hand, and put blinders on the other conversations. I would however
suggest you insist the the topics be changed so they can be filtered out.

I've not yet seen you state that the ethics/WG issue at hand is out of line, just
a distraction.

Fair enough?

-Jeff

Jeff (and APRS Spec),

Over the next week I'll flush out a few areas of your outline. I appreciated what you did when you put together the outline and related reading, and I'm willing to work a little towards combining that into one document.

Anyone care to join me?

-James Jefferson KB0THN

On Sun, 5 Aug 2001, Jeff King wrote:

> Maybe, yet you don't disagree the process is broken?

Nope. As soon as someone prepares a draft IGATE SPEC for the current system on which we can all review, comment, propose corrections, there is nothing that is broken. Until we have something to work on, then we have nothing to "process". Have you ever tried to PKUNZIP and empty file? PKUNZIP responds with a very well worded. "nothing to do"...

> others have carefully avoided the WG charter compliance issues that Ev
> and Allen pointed out.

The only thing I saw pointed out was that I failed to follow the process for proposing changes to the SPEC. BUT THAT STATEMENT HAS SINCE BEEN RETRACTED, SINCE THE ORIGINATOR OF THAT ISSUE NOW HAS PUBLICALLY STATED THAT HE WAS REACTING TO YOUR MISSINFORMATION AND NOT TO MY ORIGINAL POST. ***I NEVER PROPOSED ANY CHANGES TO THE SPEC*** LET ME SAY IT AGAIN:

QUOTE: I MADE NO PROPOSAL TO CHANGE, MODIFY, OR ADD TO THE APRS SPEC nor the IGATE SPEC. I ONLY ASKED FOR SOME CONSIDERATION OF OTHERS TO HOW WE CAN INJECT PCSAT DOWNLINKS INTO THE ***** EXISTING***** APRS INTERNET SYSTEM SO THAT WE COULD SEE (1) WHAT SATGATE INJECTED THEM, and (2) WHAT SATELLITE CHANNEL THEY WERE HEARD ON.

Now, either contribute to that discussion or stop wasting my time.

> I've seen no substantive proof that the WG even exists and that the
> charter is being complied with. Others pointed questions to this by
> others have also been ignored.

SO what proof would you like. How's this for an in-process report from a member of the APRS-WG and you can quote me:

QUOTE:

The APRSWG has openly solicited ad-nauseum for someone with the time, knowledge, interest and stamina to put down on paper how the existing APRS-Internet system works. The members of the APRS-SPEC mailing list group, consisting of many earnest and energetic volunteers have thus far produced nothing. I hold no one at fault and am not complaining. Everyone is busy. WHEN someone has the time and patience, it will get done. Until then, griping about others lack of time to contribute accomplishes nothing.

The APRS-WG has reviewed the deliberated over the 1032 Emails exchanged by said volunteers and has found nothing of any value regarding the documentation of the APRS-INTERNET specification on which to begin the formal APRS-WG review process. UNQUOTE. Bob Bruninga.

> Bob said: "I say again, until we document what we have, I am (as you
> > say) opposed to getting all wrapped around the axle with changes to
> > something we cannot see."

> Has a vote been taken on this?

No vote needed. READ IT AGAIN. THAT IS MY OPINION. Note particularly the words "I am". I don't know why I need to ask for a vote to express my personal opinion.

> With the above in mind, how about commenting on my suggesting of moving
> the WG efforts over to Source Forge. In case you lost it in the
> firefight, here is the URL again: <http://www.sourceforge.org>

I think that is a GREAT IDEA! This APRSSPEC sig is for substantive discussion of APRS specification technical details, not forever harranging everyone on what a few vociferous individuals think everyone else should

be doing with their time. Please go.

When you have put together a draft IGATE SPEC for formal review and comment, please bring it back and we will be happy to discuss the technical details and process it via the APRS-WG process...

That's easy:

To discuss technical details of the APRS specification and (currently my

focus is) to hopefully document the APRS-INTERNET system. What it is NOT FOR is constant bitching and moaning by a few on how they want someone else to do all the work...

Great! I would certainly contribute, but as you konw, I am focused on maintaining APRSdos and so I have had no tools with which to integrate the

Internet process into APRSdos. THus, I have little to contribute, or I would have done it already. SO I welcome your offer! I for one sure would like to see how it works on paper....

Go for it!

I don't know why you keep confusing what I am saying with the IGATE spec,
so I changed the topic thread.

I was talking about the APRS-WG, not the yet to be drafted internet spec.
Two different and distinct issues.

Please, go back and read what I said keeping that in light. I don't see
a point in replying to the majority of your post with you having this
misunderstanding.

Again, I was talking about the APRS-WG.

> > With the above in mind, how about commenting on my suggesting of moving

OK, now be clear in what I said and what you are responding to. I said,
how about moving the *APRS-WG* efforts over to a source forge. We would
take the existing copyright APRS-SPEC document, and break it into pieces
on sourceforge. Then interested parties could post additions to the
protocol. There would no longer be a "WG member" as there is now, and
that title would have no significance.

> When you have put together a draft IGATE SPEC for formal review

Again, two different issues. I was referring to the APRS-WG, and have
been throughout this discussion. It is you and Steve who keep bringing
this red herring up, not that I don't think it it needed, or won't
help myself.

> comment, please bring it back and we will be happy to discuss the
> technical details and process it via the APRS-WG process...

Bob, it is not clear to me there is a APRS-WG process, or at least the
published process is not being complied with as I pointed out in detail,
which you have not responded to.

None-the-less, we need to walk before we run. Many of us want a open process for protocol development. Possibly the INET protocol might be a good experiment to start with before we try to repair/redo the APRS-WG. But you have to understand it is a participatory process.

I see someone else has now stepped forward, lets see what we can do here.

Regards,

Jeff

Hi James:

I changed the title of your post as too many people are confusing the the over the air spec with the INET spec.

James Jefferson wrote:

>

Thanks James. Bill Diaz went over it with me on the phone, he basically suggested removing all the "future idea" comments.

Now, what did you think of my source forge idea of hosting it? If your not against it, I'll start researching this a little more to see if it makes sense and how to set up a APRSINETSPEC project on it, if no-one disagrees.

I placed everything I found on the INET spec on the TAPR site. You can find it at: <ftp://ftp.tapr.org//aprssig/aprsspec/aprstcp>

Thanks James

Jeff

OK, if you say I did then sorry. It certainly is a debatable point. Someone has

got to stop however.

> >Maybe we should both pull

I want to talk about that. It was a mistake.... if you look at the post log, you'll see a bunch of e-mails went out at about the same time.... in the case of your e-mail, I thought I had hit reply when I should have hit reply all. I changed it manually to reflect where I thought it should be going. You also didn't say offlist or any mention in your e-mail and the title was the same as on the SIG.

That much being said, that it was a mistake, I am not going to offer a apology to you. While you say my mistake shows what I am about, your personal feelings show what you are all about. That is, using your position and influence in the APRS/TAPR community to wage your personal vendettas. Some may give you a pass because of all your contributions, but I won't. Not acceptable behavior from a leader in the APRS community nor the moderator of a ARRL sponsored conference. I won't buy the Clinton defense.

> >> I consider you nothing but a drag on APRS, and I will do my best to make

And this from the moderator of the ARRL/DCC APRS forum and a seated TAPR BOD member. You are a disgrace. When I suggested to John Ackerman, TAPR president, that some of the members of the TAPR BOD needed training in the running and nurturing of a volunteer organization, rest assured you were the poster child I was thinking of.

But don't let it worry you Steve, no matter how hard you try, I am not going to go away. And I'm sure you'll continue to see just what you want to see in a way that most benefits your agenda of the moment. I just hope your behavior is not

driving to many other people away.

-Jeff

Okay, good plan. Let's be sure to keep a list of "future ideas".

> Now, what did you think of my source forge idea of hosting it?

I just looked at SourceForge a little. They have an impressive setup; especially CVS and bugtraq. To qualify for a Sourceforge account the spec needs to be licensed under one of their OSI approved licenses, or recieve SourceForge's approval. After briefly looking through licenses, I think the ARTISTIC or MIT licenses are the best. Other ideas?

I also run a Linux box on a very fast connection (the dual 100 megabit

ethernet cards are the limiting factor on bandwidth. See
<http://www.jarviscomputer.com/jcs/server.php>) which we can use, as
needed.

On another logistics note: what do people recommend for document
formats? I'm most familiar with HTML, but it might not be the best
markup language to use. Is Framemaker still freely available for Linux?

No Jeff, it was a lot more than that. My message was addressed only to you, aprsspec was not in the message header. Reply, or reply all, would have been only me. You had to specifically add aprsspec, and you did so. It was a deliberate, premeditated act. You are finally right about one thing though, it was a mistake. Your lame excuse just magnifies your error. And you say I act like Clinton!

And yet John, who is a paragon of patience, someone whom I admire greatly for his people skills, sent you a reply you don't mention. What exactly did he tell you, Jeff? At some point you ought to wonder why so many highly regarded members of the APRS community are telling you they have better things to do than deal with you!

Here is the message header/title in question:

Subject: Re: [aprsspec] Re: [Steve Dimse -aprsspec] Re: SATGATE Specification

Sure looks like [aprsspec] is in the header/title to me and you have been CC'ing
both to the list and me direct. Like I said, a mistake.

> Reply, or reply all, would have been only me.

Your correct. That is why I said I thought I had hit reply by mistake, and
not reply all as I intended. I then manually edited it to correct what I thought
was my oversight. Read what I said instead of what you think I said.
It is all there and it is plausible. I really don't care if you believe me
anyways.

> You had to specifically add aprsspec, and you did so.

Yeap, that is what I said I did. Might want to read what I post for once.

> It was a deliberate, premeditated act. You are finally right about one
> thing though, it was a mistake. Your lame excuse just magnifies your
> error. And you say I act like Clinton!

You misunderstand. I said it was a mistake. I didn't offer a excuse or
applogy. Frankly, I can't say with confidence I wouldn't have done exactly
the same thing even if I had been aware it was private. Your actions behind
the scene are a disgrace to the positions you hold, and what you sent me
threatening to do your best to slander/libel me to the APRS community would
have been the last straw in any case.

> >> No, Jeff, that forum I devote to highlighting the accomplishments of

> And yet John, who is a paragon of patience, someone whom I admire greatly
> for his people skills, sent you a reply you don't mention.

Oh REALLY?!? And how would you know that John sent me a reply to that message? He
in fact did, but looking at it, I don't see anyone on the CC list. It was a
private message just to me. Are you suggesting here on this SIG that the
president of TAPR is sharing private e-mail?

> What exactly did he tell you, Jeff?

Interesting and quite ironic.

So, your upset that by mistake I reposted your private e-mail to the list,
and now you are asking me to share a private e-mail from John, that by
all appearences was only sent to me, to a public list here? That does seem
kinda ironic, doesn't it Steve?

Tell you what, since appearently it was shared with you, why don't you repost
it here to the list.... I give you my permission to do so. I'm certainly not
ashamed of it, and by the reaction, or lack there of, it most certainly is
not flattering to the organization I directed it at. In fact, I beg you to

post it on the list. If some of the things that you are imply are happening, they really need to be brought out. While you are at it, copy the TAPR-ORG list as well. Lets make a big party out of it.

> At some point you ought to wonder why so many
> highly regarded members of the APRS community are telling you they have
> better things to do than deal with you!

Actually, the letter you speak of had little to do with APRS. Are you sure you got BCC'ed the right one? In any case, feel free to share your thoughts on why you think the above is so. You seem to be enjoying it and I don't want to take away from that.

-Jeff

I really see no reason why we cannot use the documentation form of GPL
(my mind is blank on the label right now). Otherwise I see no problem
with, in order, MIT or ARTISTIC, either.

I'd rather do StarOffice or XML. I could be convinced to do Word as a
concession to the non-linux-heads out there.

Not me! There's a lot more out there than just MS Windows and Linux.
Please try to choose something that is fairly universally supported
across many operating systems. I prefer HTML or PDF. There are
tools that can output a variety of formats. I use/like StarOffice
but there may be better choices. The more output formats the better,
so that more people can use the resultant specs.

I think SourceForge is a wonderful idea, both for the soon-to-be-
worked-on internet spec and for the ratified-but-needs-a-bit-of-
tweaking APRS spec.

I suspect many people on the list don't have a clear idea how
open-source development really works. While Xastir doesn't use
SourceForge, it does use many of the same tools, and the 1%
contributors really can make a difference with this system. I
started out as one of the 1% (or less) Xastir guys. I'm probably
only at 10 or 15% now, but making a big difference in Xastir.
Perhaps four or five people have direct access to the source code.
MANY others suggest changes and submit patches for one of the
developers to incorporate. It really works well. Before, when we
didn't have Xastir sources in CVS, development was quite slow.
SourceForge integrates all of the tools needed for open-source
development and lets people use them for free.

I see a lot of frustration from all parties on this list that more

I am not familiar with these tools, but what I see above sounds more like code development than spec development (I could be totally wrong). I thought the focus was on a spec, not more tweaks to linux code? Can someone clarify? Thanks
Bob

Can I recommend we use LaTeX. Use it to produce pdf for publication. LaTeX is great for producing large documents that go through several changes. It works well to systems like CVS to maintain histories. It runs on most everything except MSDos. It is very easy to learn and I'd be glad to get us started. Distribution of the output as pdf allows for easy check that it is the correct version using checksums but we all don't have to have the tools to process pdf directly.

I currently do not do much with the internet APRS. I use mostly the RF form but I'd like to see a standard done.

Yes, but be sure to keep a non-SourceForge backup of the work
being done. Free services have been known to disappear...

Source forge is OS independent, and can also used for documentation development. If you think about it, most source code is ascii text anyways, so ultimately not much different, at least in the initial stages, which is exactly where we are at now.

Source Forge also supports other tools as well, including mailing lists. One does not have to be familiar with all the tools to participate in some fashion.

And on a more general note...

I think it is important to keep KISS in mind here... and also make sure that any effort is OS neutral. We need to keep in mind that the less barriers to entry that are created, the more that can participate. Tools need to be available for the main platforms. From what I have heard so far in this thread, I don't think this is an issue, but I wanted to say that anyways.

In all the hoo-haa where I think we finally got Jim to volunteer to start gathering some APRSInet spec info together (BTW, Jim, I'd rather see it posted for info/comments in plain-text or HTML rather than a SourceForge solution, and I'll host it, if you want), I lost track of what we want.

Bob, you're saying that if I'm a satIgate, you want me to pass all received packets to APRServe as something like (e.g. PCSAT 1200baud down):
WB4APR>APR8TK,PCSAT,K3FOR-1,TCPIP:=3909. N/07636. W'000/000/BOB HOME STATION

and my -1 should indicate that receive mode? My intended implementation is to use your APRStk to steer my beam and QSY my D7, and take the rx off the serial data from the TNC and feed it in parallel into standard Igate software (Win, SA). This would seem to accomplish everything except your SSID rx-mode substitution. APRServe would see the packet and where it came from, but not *how* it came down from the satellite. APRStk would know that, but it doesn't have a way of talking to the Igate box.

.. but, the *sender* could put it in his text, unless he's an automated APRStk station, too - in which case we know that from his TOCALL, and we know what mode APRStk uses for each bird.

73,
Skip/K3FOR

> someone clarify? Thanks

The two processes are very similar. With Linux/Solaris/*BSD code, you're updating ASCII text via CVS. Anyone can check out the very

latest code via anonymous CVS seconds after it has been changed.

With a spec, assuming you're not checking in binary stuff, it works the same. Some advantages are:

- 1) Only the differences between versions are saved, keeping the repository size small.
- 2) Many people can use and/or update the text at any time.
- 3) Versions can be tagged with a release tag, and the entire set of files corresponding to that tag can be checked out as a unit at any time in the future.
- 4) Old versions of the file can be compared against new at any time.
- 5) Other "branches" can be created, such as a development branch and a release branch. Any branch may later be merged back to the main branch.
- 6) Access controls are built-in.

There are probably other advantages that might apply that I've forgotten.

There are access controls available for the different operations (read/write) so that only certain individuals can have the correct access. For Xastir we use controlled access for write privileges but completely open read privileges. It's all just ASCII text.

Note: You can use CVS with binary files as well, it just gets unwieldy. It can't save just the changes but has to save the entire file each time in that case. For files that don't change often but are part of the spec (images perhaps), CVS works well.

Hi Skip!

Project files stored/tracked with CVS are usually plain-text. SourceForge uses CVS, and also provides a web interface to CVS. Same as the xastir project. (www.xastir.org)

As an example, take a look at <http://cvs.sourceforge.net/cgi-bin/viewcvs.cgi/aprsd/aprsd/> click on the version numbers of each component to view the latest version of that file. This example is for source code destined to be compiled into a binary, but it works just as well for documents like policies, and specs or most any other 'group authored' project. Instead of 'component files' you could have 'chapter files' and even 'sub-chapters'. One nice thing is, stuff can be poked in as needed, no need to perfectly anticipate the exact file structure when setting it up ("Dang, didn't know we'd need a chapter 6.A.ii.f.5.x.045" - no prob)

The parent directory for the aprsd project is: <http://sourceforge.net/projects/aprsd/>

As long as you have a web browser, you can see the work in progress, regardless of OS or platform. With the SourceForge or TAPR mailing list (likely one or the other - not both, for public comments), feed back and comments can be easily made.

Do you have some concerns with using CVS/SourceForge that haven't been addressed?

Yes, that was my suggestion. The DIGIPEAETER call for HT's on 145.825 will be W3ADO-1*, for Mobiles using 9600 baud the digipath will be W3ADO-2. Steve was concerned about all client software being able to handle the multiple *'s in the paths, but I hope it will work or the client software can be fixed.

I setup a sourceforge project (aprsinet) for the draft APRS internet spec.

Please take a look at <http://aprsinet.sourceforge.net/> and visit the CVS tree with all documents and source code. There isn't much to look at yet, but with enough contributions (no matter how large or small) the spec will happen.

If you wish to contribute large sections the draft spec document I can set you up with CVS write access, otherwise feel free to e-mail me your additions and changes, and I'll merge them in. CVS allows each version of each file to be tracked and diff'ed against earlier and later versions - so the evolution of the documents will be obvious and traceable.

73's,

-Jim Jefferson KB0THN

Hi,

There was a thread on this topic in late June that started with my confusion in trying to decode area objects by reading the spec. After discussion in that thread with Steve Dimse, we concluded that the spec was a bit misleading and came up with the following equation:
$$\text{offset_in_degrees} = (\text{offset_in_packet} / 100)^2$$

Later, I communicated privately with Bob because this equation still seemed to create the wrong size areas. He sent me some example objects, describing their sizes (i.e.: rectangle 20miles by 30miles), for me to compare. I then was sure that the above equation is not correct. Bob then sent me a code snippet and I believe I found the correct equation and a possible explanation of the confusion:
$$\text{offset_in_degrees} = (\text{offset_in_packet}^2) / 1500$$

Using that equation gave me areas with sizes the same as the example objects that Bob had sent me. I believe the confusion may have come from the comment near that section of code that talks about 100ths of a degree squared.

Comments?

Can somebody please help me figure out what these packets are and what produces them. As two people were APRS chatting this evening I saw dozens of packets like this go by:

```
NOAN>APS200,KI0BW-4,KB0JBF-1,WIDE*:}KI0BW-5>APRS,TCPIP,NOAN*:!!  
000000D902ED0406-----00F
```

It appears that an IGATE is attempting to gate the message to RF. Is that right? Is the IGATE misconfigured or is this normal behavior.

-Jim Jefferson KB0THN

Jim,

The weather station part of the packet I understand. What I'm wondering about is the } indicating user defined format, as well as what seems to be a packet encapsulated in the first one. It appears that his packet made it out to the internet (TCPIP is in the second path), then somebody gated it back to RF and didn't strip out the original path.

-Jim

The early registration discount for both the hotel room rate, and the

registration fee, expires on September 10, so you only have a couple more days to get your reservations and registration made at the lowest price. Registrations at the normal price will be available and at the door (of course, hotel rooms will be subject to availability).

The DCC begins on Friday, September 20 and runs through Sunday, September 22. Full details are available at <http://www.tapr.org/tapr/html/Fdcccconf.html>.

A couple of updates on the program:

1. We're very happy that Anthony R. Curtis, Ph.D, K3RXK, will be our speaker at the DCC banquet. Tony's presentation will be titled "40 Years of Amateur Radio In Space: Where We've Been, Where We Are, and Where We're Going."

2. We've confirmed that the Packet Radio Users Group (PRUG) of Tokyo, Japan will be sponsoring a reception and talking about their latest activities Friday evening. PRUG is really on the cutting edge of digital radio, and their presentations are always fascinating.

3. We are also fortunate to have three great activities that focus on the hardware and soldering-iron side of amateur radio:

- * On Saturday, Jay Craswell, W0VNE, will do an introductory program on using CirCAD, a powerful schematic drawing/PCB layout program that's available (in a slightly limited form) for ham use at no cost.

- * Also on Saturday, Ten-Tec's Gary Barbour, AC4DL, will be talking about Software Defined Radio development at Ten-Tec.

- * Our "Sunday Seminar" will feature Dave Newkirk, W9VES, providing a tutorial on using the Serenade SV RF design software; this is another professional package with a free version available for ham use.

We hope to see you there!

In a previous email I incorrectly stated that the Circad schematic drawing and PCB layout program is available for Ham use at no cost. I misunderstood the relationship of the various versions.

There is a highly discounted version of the \$995 Circad program available at \$295. This \$295 version is available to Licensed Ham/Amateur Radio Operators only. Check out <http://dover.5u.com/> for more info on the Ham Discount.

There is a demo version of Circad downloadable at <http://www.holophase.com>; although that version can be used to draw small schematics and PCBs, it's not a replacement for the full program.

I want to apologize to Holophase and to Jay Craswell for improperly describing the versions of Circad, and to you for any confusion this may have caused.

With the tragic events of this week, we've had to seriously consider whether it was still appropriate or feasible to hold the Digital Communications Conference next weekend (Sept. 20-22) in Cincinnati. Although we grieve with the whole world for the losses so many have suffered, we believe it's important to show that terrorism will not succeed in making us change our way of life.

So, the DCC will go on. We realize that in light of the circumstances, some folks who have already registered may feel they cannot attend. If that is the case, please contact the TAPR office (tapr@tapr.org) and we will arrange a refund of your registration fee. If you are traveling to the DCC, remember that things may still be somewhat disrupted next week, and increased security precautions will certainly cause some airport delays. Check with your airline early and often to make sure they haven't changed your plans for you.

We realize that this year's DCC may well be smaller, and will certainly be more somber, than in past years. But we think that going ahead is the right thing to do, and we hope that you agree.

73,
John

The APRS Working Group is pleased to announce that Bill Diaz, KC9XG, and Roger Barker, G4IDE, have joined the WG effective immediately.

Bill is the author of the A-Filter software and has been actively involved in discussions around the APRS Internet specification. Roger is the author of UI-view and brings a valuable international perspective to the WG.

We're excited to have them in the Working Group, and look forward to the

value they will add to the APRS standards process.

For the APRS Working Group,

John N8UR
Administrative Chair

Well, the Digital Communications Conference is only a few days away. If you can make your way to Cincinnati, Ohio this weekend (Sept. 21-22) we invite you to attend the show -- registration is available at the door. Full details, including the current schedule, are available at <http://www.tapr.org/dcc>.

Here's a brief rundown; note that due to the tragic events of last week, we've had to make some adjustments to the schedule.

Friday:

Registration Opens 9:00AM

APRS Forum 1:00 - 6:00PM
(The morning part of the Forum has been cancelled.)

PRUG Social 7:00PM
activities (Come enjoy the hospitality and see the latest
of the Packet Radio Users Group of Tokyo, Japan.)

Saturday:

Registration Opens 7:15AM

Main Program 8:00AM - 5:00PM
(There will be a mix of introductory sessions on new
aspects of digital communication, as well as more
advanced topics. We think there'll be something
for everyone.)

TAPR Membership Meeting 5:00PM

Banquet 7:00PM
Amateur (Anthony Curtis, K3RXK will speak on "40 Years of
Radio in Space.")

NOTE: We've regretfully had to cancel the Sunday Seminar. If you
registered for it, please stop at the registration area or contact TAPR to
arrange a refund.

Is there a forum, other than this one, to speak to the APRS developers,
without involving the main APRS sig?

Except for the line object (type 6 - down/left) all area objects are referenced from their upper left hand corner. This is problematic when considering the circle, ellipse and triangle objects. Where is the upper left hand corner of an ellipse, circle, triangle?

Wouldn't it make more sense to say that these objects are referenced from the upper left hand corner of the "bounding rectangle" containing the object? The bounding rectangle would be the smallest possible rectangle containing the area object. All versions of the Windows operating system reference circles and ellipses drawn by their "bounding rectangle". While I understand that the original concept was developed as part of APRSDOS, it might make sense to change the APRS spec in this regard to make it consistent with the majority of the pc operating systems in use, especially when we are trying to gain consistency with the way these objects are drawn on a map. My guess is that all Intel based operating systems draw these objects in this fashion. Perhaps our Linux developers can shed some light on this.

Triangles?

Can we assume that we are talking about equallateral triangles? If so, wouldn't it make sense to refer to the position as the first point on the triangle, the offset as the second point, then draw the rest of the triangle in a counter clockwise fashion? This also allows us to draw the triangle at any "angle".

Also, what would the practical use of a triangle as an area object be? Can anyone think of examples?

Regards,

Rich - Wn0x

For the circle it is the upper left corner of a box that contains the
circle.

Yes. same thing.

No change needed, since what you suggest is the way it is supposed to be,
unless you are saying that the wording is confusing?

The first point is the APEX. The second point is the lower right. Since
it is an isosceles triangle, then the other side is defined.

Hope that helps.
bob

Unless I missed something, no mention is made of a bounding rectangle for circles/ellipses. Also, no mention of how a triangle object is supposed to be drawn either. This would be a big help.

>No change needed, since what you suggest is the way it is supposed to be,
>unless you are saying that the wording is confusing?

Thanks for your help Bob.

I understand (offset_in_packet^2), but why are you dividing by 1500 instead of 100
(1/100ths of a degree)?

Is there a reason why the alternet symbol table wasn't used for the area object?
I was under the impression that it was required.

>>> Bob Bruninga <bruninga@usna.edu> 07/26/01 07:33AM >>>
Here are the codes for two test objects:

```
;CIRCLE *071423z3900.00N/07200.00W/15211325 with a radius of 22.3 mi  
;RECTANGLE*071424z3900.00N/07200.00W/19321331 47mi high by 35 mi wide
```

RB> I understand ($\text{offset_in_packet}^2$), but why are you dividing by 1500
RB> instead of 100 (1/100ths of a degree)?

First of all, forget what the spec says. From what I understand, the information in the spec is the best that the spec writer could come up with when he wrote it and it did not receive much attention before the spec was released.

If you check out the archives of this list, you will see a few threads on the topic of area objects, at least one instigated by me. The division by 1500 was something I found after talking to Bob and receiving a snippet of basic code from him (presumably of APRSdos). I can assure you that this code I saw does the following operation:
 $(\text{offset_in_packet}^2) / 1500$

My theory on where the 100ths comes from is the `_comment_` at this line of code which says this: Increments of 100ths of a deg^2
Remember, the comment says that but the code does divide by 1500.

If you want to look at code that I believe is correct, check out a CVS copy of the Xastir source. You can find out how to get it at www.xastir.org

I'm not sure, but it may be that Bob typed these in by hand. As far as I

can gather, your comments above are accurate and correct.

Rich,

Try these instead:

```
;CIRCLE *071423z3900.00N\07200.00W15211325 with a radius of 22.3 mi
;RECTANGLE*071424z3900.00N\07200.00W19321331 47mi high by 35 mi wide
```

Note the backslash between the lat/long and no slash after the W. Also note that the character after W is a lower case L and not digit one.

73 de sm5nrk/Roger

To scale it down to usable sizes. Since we only had digits from 01 to 99, then we only had a certain range of sizes. It was felt that 1500 as a divisor got them down to small sizes that were useful while not limiting the large ones too much...

So it is just a random scaling factor.

If I remember correctly the smallest box can be 60 feet across?

and the largest 100 miles or so? Been a long time... so you are closer to knowing the answer than I without a lot of research...

But we did want to be able to draw a small box...

Bob

Yes, I goofed! SShould have been an alternate table. I better check my code. (It originally was primary until we added the alternate table) then it made more sense for it to be an alternate. So we wwrote the spec that way. Most of us probably accept either. But I should definately not have been transmitting it that way!

Because the spec itself is wrong! It has a few other deficiencies:

Ellipses haven't been implemented in any software yet (someone correct me if I'm wrong).

Triangles are always isosceles triangles, oriented vertically as Bob said. The spec needs more detail as to their definition, including the fact that they are isosceles, oriented vertically, and where the point of reference is located.

The exact definition of circles isn't specified in the spec. I think Bob said they fit inside a box with the lat/lon dimensions in the packet.

The point of reference for objects is different than the spec uses. Spec says upper-left. Lower-right is correct for some, one line uses lower-left, one line uses lower-right, circles use center, and triangles use lower-right again.

Curt, I don't think this is right. I believe all the shapes are referenced by the upper left corner of the "Bounding Rectangle" that contains the area object, even for circles.

The only exception is #6 - Line (offset: Down/Left)

Incidentally, if you use a bounding rectangle, there is no need for a "circle" object. It is simply an ellipse bounded by a rectangle of equal sides (square).

Bob,

I noticed that if I use the example circle you provided I end up drawing an ellipse. Can this be corrected and still project the maps in WGS84?

In what kind of software? Or map projection? Mercator? Circles of equal radius on those maps (Like WinAPRS) will always are an elipse. APRSdos varies its longitude extent by the cosine of the latitude so that a circle of equal range is a circle on the map... It really doesnt matter. As long as a "circle" of radius 50 miles plots as a graphic that is 50 miles in all directions from the center...

Hope that helps
Bob

Nope. You're probably looking at the spec. It's not correct in this
instance. That part of the spec evidently wasn't gone through with
a fine-toothed comb before release. See how APRSdos does it. That's
basically the first reference implementation, and the spec was

written after APRSdos. Note that you'll see size differences still between WinAPRS and APRSdos w.r.t. area objects. I think the sizes are the same now between APRSdos and Xastir, thanks to Olivier.

> Incidentally, if you use a bounding rectangle, there is no need for a "circle" object. It is simply an ellipse bounded by a rectangle of equal sides (square).

No argument there. The area object definitions in the spec could use some rethinking (my opinion).

> I noticed that if I use the example circle you provided I end up drawing an ellipse. Can this be corrected and still project the maps in WGS84?

The reason it draws an ellipse with some map software/map projections is that the aprs spec defines the sizes in lat/long, not in distances. You have to mismatch the X/Y offsets in order to see circles or squares with any map software that uses equal-distance projections. I think I said that right.

We would have to check with Bob, but am am positive he advised that even circles
are referenced from the upper left hand corner of their bounding rectangle. It
does make sense to draw a circle from its center though. Much easier for the end
user to visualize when they are creating the object.

If you have a test log, I would be glad to run it and send the output to you for
comparison. Heck, lets post it on a web site so people can look at it and
compare.

Yes, "bounded by the box" but the box in this case is defined in the
AREA-OBJECT format as the upper left corner and the center...

Now you have lost me. How can the circle be "bounded" by its upper left hand corner and the center? To be "bounded" the circle must lie completely within the boundaries of the rectangle. Are you saying the the Offset is the center of the circle, and the POSIT is the upper left hand corner?

Rich

On Thu, 27 Sep 2001, Rich Beckwith wrote:

> > Curt, I don't think this is right. I believe all the shapes are referenced by the upper left corner of the "Bounding Rectangle" that contains the area object, even for circles.

It's the lower-right corner though. The spec is wrong in this regard. WinAPRS draws area with different sizes than APRSdos, but I think it draws them with the same reference point (lower-right).

I can't claim to remember anymore what Bob said about circles. The Xastir developer who coded the area objects went through great pains to make sure that they agreed with Bob view. It's always possible he missed one though.

I could start up a virtual machine here to test things but don't have the time right now. Would have to install the programs and such.

Can someone with WinAPRS and/or DOSapr create a few area objects and report back where the reference point is located? Also the approximate sizes of the objects?

> We would have to check with Bob, but am am positive he advised that even circles are referenced from the upper left hand corner of their bounding rectangle. It does make sense to draw a circle from its center though. Much easier for the end user to visualize when they are creating the object.

>

> If you have a test log, I would be glad to run it and send the output to you for comparison. Heck, lets post it on a web site so people can look at it and compare.

I'm game. I'd like to see what Bob and the rest of the authors have to say about it. I do have a test file, but I'd have to run it down.

I'll bug Olivier and see what he remembers about circles. It wasn't too many months ago that he implemented area objects.

It'd be nice to get public buy-in _and_ get the spec corrected, so that new authors don't go down the wrong path.

To answer Kurts question:

It is "upper left to lower right". But I think the lower right point is the LAT/LONG transmitted and the offset then refers back to the "offset point" which is the upper left.

THis is all just symantics. You see, in DOS you have to move the cursor to the upper left corner. Then center the MAP as the starting point. (hit HOME key) then move cursor down to the lower right and hit INPUT-ADD-OBJECT etc... Thus "upper left to lower right"...

But it is the coordinates of the CURSOR (now in the lower right) that are placed into the OBJECT format and the offset refers back to the original upper left point which is now at the center of the APRSdos map.

You see, APRS dos has no click and drag. SO I used the MAP center and cursor locations as the two points to define objects...

Hope that helps...

Very close. The posit is the center of the circle, and the offset is
the upper left corner of the bounding box.

Hopefully you saw that last message from Bob B. He explained how he was generating the objects with his software. Good info.

Try this:

<http://www.eskimo.com/~archer/objects.html>

It has a link to the file I used to generate the objects as well as screen grabs from Xastir.

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tapr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with

≥this is off-topic≤ then you are violating this rule.

- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)

- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)

- . Do not send messages in HTML or Rich Text format.

- . Do not send attachments.

- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)

- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Hi Jim,

You can construct them yourself using the info in the spec. That's what I just did to test my algorithms for the Cybiko. It gives you a good understanding of the encoding process.

Is there any current work been done on sending pictorial weather information? To be more specific, a way to send pictorial storm info (radar, cells etc) or fronts etc.

I have put a few notes together on a drawing message that could in a single packet, describe multiple drawing items that could be overlaid on a map.

I would welcome any comment.

<http://www.golborne.com/pubfiles/APRS%20draw%20message.txt>

Bob B. had proposed a drawing format earlier that would enable
sending multiple line segments in one APRS packet. As far as I know
it was never implemented or added to the spec though. You might to
into the archives and compare yours with his.

If some agreement could be made on this issue, I'd certainly try to
contribute by adding the feature to one software package. I'd like
more drawing capability than the APRS spec currently provides for.

I would like to hear some comments about the PHG calculation and why it appears to me that it does not take into account for the earth's curvature.

While doing to recent upgrades to the TNC's in the Houston area (All running UIDIGI) I was twiddling with PHG numbers so that I could get accurate coverage circles drawn around them. Most of the digis that I have (or control) are on tall buildings or towers, usually co-located with voice repeaters that are of known coverage areas.

I will just use ONE site in my example since it is easy to deal with.
Site location: Building top in Downtown Houston. Terrain FLAT (less than 100 feet of elevation change in any direction for 60-100miles). Building elevation above ground 650ft (pretty close to the 640) Digi Power output: 110Watts, 6DB (DB224 ant). This gives a range of 85miles.

Not a Chance!

IF I play with the numbers I can get the range that is accurate (35 miles SOLID coverage and 45 miles of 50% missed packets) If I use a number of 9430 for a range of 35miles. I can assure you that NO radio at 160ft covers that well.

If I play with other values it only gets worse. If I use our former site at 1400ft with a 12dB gain ant and 50Watts (UHF) (PHG7790) shows a range of 126miles....Not a chance! I had trouble shooting two 80 mile link paths with the both ends using yagi's and 300ft of elevation on the far ends.

I admit I only use APRS+SA so don't know about the others map apps, but wouldn't it be better to ditch phg and just use rng instead (APRS+SA does not support RNG).

Comments?

For what it is worth,

real world, 8 watts at digi (formerly NAARS), home-made j-pole, 600 feet difference in it and my former location location, 43 miles separation, 100% copy.

real world, 10 watts at digi (WHTNY), home-made j-pole, 200 feet difference, over 200 miles separation, over 50% copy. digi-to-digi.

real world, 10 watts at digi (WHTNY), home-made j-pole, 200 feet difference, 23 miles separation, 100% copy. digi-to-qth.

real world, unknown watts at digi (CVNL), unknown antenna, aprox. 140 feet difference, 83 miles separation, better than 50% copy. digi-to-qth.

I know that if we go by PHG only, there are some differences in what we calculate and the real world. The best software I've seen for calculating coverage areas costs more than I would ever pay for it and uses geographical data. I have plotted this area and it was very accurate, but not 100%!

If your going to use PHG, then go a little conservative on your numbers and let it go at that. Then you can claim everything outside the circle as a bonus! <grin>

It was designed around relatively low antennas and it also more or less used radio ranges for voice repeatets (which works for fixed stations). But AX.25 mobiles suffer 30 dB or so worse performance because of mobile flutter (multipath) so the REAL circles are LOTS smaller than the PHG for a fixed station...

Problem is, we have such a mix of mobiles and fixed stations, that what is right for one is wrong for the other. I would prefer that we draw TWO circles around each PHG station. One is the existing one and the other is about HALF the range and is for mobiles.. hummh.....

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tappr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with

≥this is off-topic≤ then you are violating this rule.

- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)

- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)

- . Do not send messages in HTML or Rich Text format.

- . Do not send attachments.

- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)

- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

Hi Everyone,

I implemented a very simple NAVI-TRA posit to APRS conversion (per Bob's specification)

Here is a sample packet:

SOURCE>APRS:@072146z3546.79N/13929.51Er005/000/TOKOROZAWA

that was generated with the following input (captured from real data)

SOURCE>APRS:

\$PNTS,1,0,07,11,2001,214654,3546.793,N,13929.515,E,64,,5,TOKOROZAWA,000,1*16

I've attached the source code, which I developed on a Linux box (but should work on anything, hopefully). It's not pretty, but I think it works.

-James Jefferson KB0THN

#include <stdio.h>
#include <string.h>

double atof();

```

unsigned char
nmea_0183_checksum (char *p)
{
    int checksum, start, done;
    checksum = start = done = 0;

    for (; *p != '\0'; p++)
    {
        if (*p == '*')
            done = 1;
        if (start == 1 && done == 0)
            checksum = checksum ^ *p;    // XOR
        if (*p == '$')
            start = 1;
    }
    return checksum;
}

int main(void)
{
    char information[256];
    char *p = information;
    char buffer[256];

    int i=0;
    int j;
    int len=0;
    char elements[20][20];    // Store each element until we can put in structure
    int element, last, checksum;
    unsigned char local_checksum;

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tappr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with ≥this is off-topica≤ then you are violating this rule.

- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)
- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)
- . Do not send messages in HTML or Rich Text format.
- . Do not send attachments.
- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)
- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Hello, APRS Sig -

The list has been a bit quiet for a while. Here is a question that may well have been answered previously, but lacking a searchable list archive, I can't seem to find the answer.

On page 58 of the specification, it says: "An Object always has a timestamp."

But, on the previous page, 3rd paragraph, it says: "Object Reports specify an Object's position, can have an optional timestamp, and can include"

Which one of these is correct?

Many thanks to all of you,

Jim Wagner

Regarding the time stamp in Objects:

I think that is a mistake in the writing of the spec. APRSdos and I dont think any of the other original programs recognized a format without a time stamp. This is because unlike the @,/,= and ! formats which DO and DO-NOT have time stamps, the object format has no such sub-identifiers. Thus heuristics would have to be used to tell the difference and that was not our plan.

But once we moved the ";" to the front of the packet, then that DOES leave open the possibility of redefining the meaning of the "*" character which could then have other modifiers. But this would have to be a NEW ADDITION to the spec VERSION 2...

Ah yes. That is why we saw no need for the options under OBJECTS..
thaks for the refresher...

<http://www.taprr.org/taprr/html/taprrfhss.html>

Hi All Hams,

ISDN Speeds over ham packet radio...

Check out these two webpages... It sounds like the next phase of =
Amateur Digital Communications...

As far as building a nationwide Network.. Read on about it ... and =
consider the possibilities... they are talking of Internet Radio over =

Ham Radio... It seems it could be used for the present store and forward =
packet radio and work as one with that also???=20

I as an Amateur Radio Operator plan to follow this with much =
interest and quite possibly jump right in as it comes to be...
=20

I Urge all Hams to follow this with a watchful eye, and consider =
atleast stopping by the webpages and if you like what you see.. Let them =
know that there is much interest in their new project at TAPR....

I also urge all Ham Radio Clubs to pass this info on to its members, =
so we are ready to act when the time comes to both support and encourage =
the faster Digital Links...=20

Its time to Put RF back into Ham Radio...

Once it gets going either put up a high speed link in your area or =
urge your local Amateur radio Club to put up high speed links and or =
help support them in your area...

But above all please atleast follow the above links and inform as =
many Amateur Radio ops or soon to bees.. about the TAPR Project...!!!

Best 73 And Happy New Year!!!

Jerry kutche N9LYA
HHHCVP
TAPR and ARRL Member...
Sysop of W9QYQ's Ham Radio Packet Station=20

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tapr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with ≥this is off-topica≤ then you are violating this rule.

- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)
- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)
- . Do not send messages in HTML or Rich Text format.
- . Do not send attachments.
- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)
- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Earlier today, I changed two of the options of this list:

1. Only subscribers to this list are now allowed to contribute messages to this list.
2. All new subscribers to this list must be approved by the administrator of this list.

Item 1 means that you can only send messages to the list from the email address that you subscribed with. If you are using a different email address to send messages to this list, you will have to subscribe with that email address, too. (If you do this, you can eliminate the duplicate receipt of messages from the list by setting one of your subscriptions to receive no mail from the list.)

Item 2 means more work for me, but that's why I get paid the big bucks for administrating this list.

I made these changes to APRSSIG last year and they eliminated the spam and other nonsense that the APRSSIG was experiencing. The changes should have the same effect here.

By the way, some may ask why I don't set up some filters to eliminate the problem, but that is not an option with the SIG software TAPR uses.

Thank you for your cooperation,

Stan, WA1LOU, Your List's Administrator

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tapr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like >what kind of printer should I buy to print out my copy of the APRS specification?<) may be considered off-topic. If you start a message with >this is off-topic< then you are violating this rule.

- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)
- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)
- . Do not send messages in HTML or Rich Text format.
- . Do not send attachments.
- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)
- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

SUBSCRIPTION MAINTENANCE

You may make changes to your subscription (like change your email address, toggle on/off the digest mode, etc.) by logging into the APRS SPEC SIG at <http://www.tapr.org/cgi-bin/lyris.pl>

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC SIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Content-Transfer-Encoding: quoted-printable

Hello Everyone.

I am in the midst of completing the incorporation of APRS compatibility =
into my weather code (WXN). Before I get into this very deeply, let me =
say that the group has done a very good job in preparing the document. =
Also, understand that my primary interest is in the exchange of weather =
data. While I have done my best to understand how all of this works =
together so as to not cause any problems, I do not run any other APRS =
type of software here except my own. Please forgive any misconceptions.

I do have some questions, observations, and a couple of requests. These =
are not in any particular order. The original message was not accepted =
by the list server, and therefore has been split into two parts.

1. Although not stated in the protocol, every single APRS packet has a =
CR appended at the end (0x0d). I imagine this comes from the fact that =
the SENDPAC and CR parameters in the TNC firmware default to this. The =
beacon I implemented in the first release did not have a CR appended. =
The web based APRS sites seem to handle this just fine. However, some =

locals had problems seeing my station. Probably would not have noticed =
this except for the fact I am using the KISS interface rather than the =
standard user interface. Therefore, by the specs, I did not append a CR =
(this has since been corrected). Might want to consider adding this into =
the spec.

2. Chapter 12, p. 64: In the positionless weather report format boxed at =
the top of the page, it appears that the field length for barometric =
pressure is six, not five as shown. The length of all the others is the =
character ID plus the length of the numeric data.

3. Chapter 12, p. 66: Second example (compressed position, no timestamp) =
appears to have an extra character in the string (>). It is =
inconsistent when compared with the other examples on the same page and =
with the statement in chapter 9, p. 37 (length is fixed 13 characters). =
I have been monitoring packets for several days and have yet to see a =
compressed format, so can't compare this against anything real.

4. One would logically assume that wind speed would use the same units =
in all types of weather reports. However, if I abide strictly by the =
rules in the protocol, the examples on pp. 65-66 are using mixed units =
for wind speed (i.e., c.../s... is in knots and g... is in mph). The =
positionless report explicitly states that the speed in mph (p. 64). In =
accordance with the warning at the end of chapter 5, I used knots in the =
c.../s... section and mph for gusts. Since this behavior is =
inconsistent, to say the least, I think it would be worth noting this in =
the appropriate section of chapter 12.

5. In chapter 12, p. 63, the trailing field on the packet can be a 2-4 =
character field identifying the type of weather station. You have a =
number of types already defined. My code supports some additional =
stations not listed. I have added identifiers for stations not listed, =
and also some alternates. This seems to be consistent with what I have =
observed on the air. I will still occasionally get a wx packet in which =
the wx station cannot be identified. I was wondering if there is an =
updated list, and/or do you want to know what identifiers I have added?

6. Again, in chapter 12, p. 63, the next to the last field is the =
software identifier. I have elected to use lower case 'n' for my code. =
If there are future revisions, would you consider adding this to your =
list?

continued in part 2...

continued from part 1...

7. My code has been around since 1990. As such, it has used the =
connected network as a means of exchanging data between the different =
servers. I want to add the capability to APRS. The purpose of these data =
packets is allow other WXN servers running APRS to receive the complete =
dataset, which far exceeds what APRS natively supports at the present. =
There appears to be two options available: Telemetry Data as described =
in chapter 13 and the User-Defined Data Format in chapter 18. I decided =
against the telemetry mode, mainly due to the restriction of 3 =
characters for a value. In some cases, I have values that are ten digits =
long. The User-Defined mode seems best suited for my purposes. At this =
point, I have an alpha version that I am about to begin debugging that =
uses ASCII comma delimited data with group separators. Currently, I have =
two defined packet types, each less than 200 bytes (excluding the 3-byte =
APRS header). I have been unable to find the web site described in the =
document that shows what the defined user IDs are. On the TAPR site, =
clicking on the "Working Group" takes you to APRS Spec page. I assume =
that my request for a "User-Defined Packet Type" character should go to =
this group. I can furnish what the packet types, data fields and groups =
are, if so requested. Once I release the version that incorporates this, =
the format will be published on my web site.

8. Chapter 20, p.93 discusses the use of the SSID in the source address. =
In all the packets currently used, the information field contains the =
APRS symbol for weather, therefore overriding anything else. However, =
the user-defined packet does not seem to provide for the use of the APRS =
symbol. Is the source-address SSID ignored for the purpose of =
determining an appropriate symbol with a user defined packet? If it must =
be imbedded in the user-defined packet to avoid the problem, is it =
position independent? Failing that must the symbol be placed into the =
destination address? Or perhaps, just ignore this?

9. On p. 14 (chapter 4), the last section deals with APRS Software =
Version number. I have adopted the string 'WXNxxx' where 'xxx' =

represents the current version number (in light of item #8 above this =
may need to be modified to avoid the symbol problem). This seems =
consistent with what I have observed on the air and what's in the spec. =
If there is no problem with this, I would like to have my identifier =
added to the list on the next revision.

73,
John Bennett

Is there any provision for "no sensor"?
I have seen a lot of weather output where it is obvious that there is
either no sensor, or a drastic error (air pressure 0.0mB)
This was one point that Dr Arnold commented on when I walked him through WAPRS.

On Sun, 3 Feb 2002, David VanHorn wrote:

> Is there any provision for "no sensor"?

Yes, omit the field. Only the wind speed and direction and TEMP are
actually required (I think)...

At least that was what the original APRSdos did//

This interfaces through a serial port, and APRS stations have the infrastructure to collect some possibly useful data.
Is there a hole in the spec that it can wedge into?

I dont have a clue what you are talking about. Is this radiation?
I looked at the plot and all I can guess is that CPM could be counts per minute and RADS are radiation, but I have no clue what the unit of mesure of Muncie is...

Tell me more..

Bob

It's counts per minute, here in muncie indiana.
The detector is sitting on my desk at the moment, but I have plans for an
outdoor mounting that will be less shielded by the house.
Of course the house doesn't offer much shielding from gammas.

I plan to give it a view of the ground, from about 5', sort of like a
thermometer shield.

I could see this being useful if there was any sort of radiological event,
either deliberate, or accidental. Knowing where the plumes are, would be
helpful.

About 150, www.blackcatsystems.com

It's a nice simple box, just plug into a serial port.
I'm using it through a USB serial port now.
Software's pretty basic, but it's doing the job.
You have to install quick time 4.0 to make the pictures.

Hello APRS Spec people -

For some reason, there is no description of the Ultimeter weather station decoding in the APRS spec. Where would one find that little detail?

Many thanks,

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tapr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with ≥this is off-topic≤ then you are violating this rule.

- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)
- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)
- . Do not send messages in HTML or Rich Text format.
- . Do not send attachments.
- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)
- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

SUBSCRIPTION MAINTENANCE

You may make changes to your subscription (like change your email address, toggle on/off the digest mode, etc.) by logging into the APRS SPEC SIG at <http://www.tapr.org/cgi-bin/lyris.pl>

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC SIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Stan Horzempa, WA1LOU, wallou@tapr.org

I've seen a few messages that of the form:

:K6JQ- :message

Where there's a dangling '-' at the the end of the address. My prototype code enforces AX.25 address rules rather strictly and considers a dangling dash an error. What do other implementations of APRS do? Obviously, there's at least one implementation that's permitting (what appear to be) ill-formed addresses here.

Dana,

The message addressee does not have to be a valid AX.25 callsign, or even a valid amateur callsign. It can be any 10 character alpha numeric string. Bulletins are the most common message that is not addressed to a callsign, but specialized services like e-mail and callbook lookup also use this property.

Good luck!

-James Jefferson KB0THN

PS - Does Lyris *have* to be set to such an incredibly low limit on quoted lines?
Darn annoying.

APRS has a 9 character "CALL, ADDRESS, or NAME" field. But only
callsigns or names used over RF have the limitations of the SSID
construct. Objects do not.

In order for an APRS message to be recognized by an ON-AIR TNC using
AX.25, yes, the message TOCALL must be AX.25 compliant.

But I dont immediatly see why such a restriction needs to be enforced on
the message TOFIELD. An example exception is the use of a Bulletin group
of the name AMSAT for example. A bulletin to the bulletin group would be
BLN#AMSAT

This is my interpretation of the spec, as well, with perhaps a slight
difference when it comes to "over RF"...

>>>>In order for an APRS message to be recognized by an ON-AIR TNC using
>>>>AX.25, yes, the message TOCALL must be AX.25 compliant.
>>

... I don't limit my thinking to an "on the air TNC" here. If the address field of the message is ever going to be compared to an AX.25 address, on the air or not, I believe it needs to be compliant. I tend to suspect you're saying the same thing but using the phrase "on the air" to clearly delineate the difference between an AX-25 address that *could* be used in the address field of an AX.25 frame and an arbitrary 9-character string.

> But I don't immediately see why such a restriction needs to be enforced on
> the message TOFIELD.

Neither do I. I'm asking about the case of where an address field is clearly intended for matching against an AX.25 address and contains a dangling dash. I think it's always clearly an error but apparently there's at least some software that tolerates it in a relative safe way.

Thanks!

Looking through the spec, trying to determine what sort of weather packets my new mobile weather thingy should send out..

I see five data type identifiers, !, #, \$, * and _
I'm not an Ultimiter or peet, so that leaves me with _ which is positionless. (you hafta be a big boy to send positions?)

The next paragraph seems to tell me that I could also use !, =, / or @, (note that ! is used above already, seems ambiguous), but I am not given any rationale to make a particular choice. They are identified as "position data type identifiers". A quick scan through the document does not turn up where these are defined, so I'm still in the dark.

Anyway, proceeding.

Positionless reporting seems a bad idea for a mobile weather station, skip that.

The next one that pops up, is a "complete weather report with timestamp and position". It does seem to me, that along with weather observations, it would be useful to know where, and when those observations were made, so this looks like a good candidate.

The first format shown is for a "complete weather report with timestamp and position", lacking a timestamp. (hmm...) Skipped.

The second looks better, in that all the pieces are present.
So:

Field 1: 1 char / or @ (How do I decide?)

Field 2: 7 char, "DHM/HMS" No idea what this means. The example data is not interpreted, so I'm left with trying to parse "092345z" Does this mean 09:23:45 Zulu? or 9th of the month, 23:45 Zulu?, or some other thing?
If the time is not zulu, then what do I put in place of the Z?
If it always must be zulu, then why is the Z there?
What happened to the slash?

Field 3: 8 char Lat: fine, no problem.

Field 4: 1 char Sym table ID ??? (Does this mean the icon?)

Field 5: 9 char Long: Fine, no problem.

Field 6: Symbol code ???

Field 7: 7 char, wind dir and speed (as opposed to "weather data?")

Field 8: variable, weather data

I assume, though I am not told anywhere, that this is a frame that I build from the sensors and data I have to send, in the format presented under "Positionless Weather Data", except that the wind direction and speed were already done in the previous field, and not required here.

Field 9 1 char APRS software

Field 10 2-4 chars Weather unit

Both of these fields are shown as optional, yet if field 10 is missing, then how can you parse it? If you have three chars at this point, is it APRS software and two chars of wx unit, or is it three chars of wx unit? Bad design here, the two variable length fields should have been placed together, since I can deterministically locate the end of the weather data, and the end of the packet.

But it isn't, so what DO I do with these, given that I'm not running any APRS software, and I'd like to send an "AVR" identifier?

On Sat, 16 Mar 2002, David VanHorn asked about a Mobile WX station:

> I see five data type identifiers, !, #, \$, * and _

> The next paragraph seems to tell me that I could also use !, =, / or @,
> (note that ! is used above already, seems ambiguous), but I am not given
> any rationale to make a particular choice.

For a mobile it is easy. Use a position weather packet like this:

@DDHHMMzLAT/LONG_weatherdata goes here....software identifier

This way in a single packet with time stamp you have the position and the weather data.. all in only one packet. Put an ID on the end to indicate whatkind of software you are using..

> Field 2: 7 char, "DHM/HMS"

Day hours minutes

> Field 4: 1 char Sym table ID ??? (Does this mean the icon?)

This must be the "/" primary symbol table to get the Weather icon.

> Field 6: Symbol code ???

This must be the "_" Weather Icon

> Field 7: 7 char, wind dir and speed (as opposed to "weather data?")

Wind direction and speed are part of the weather data you want to report.

> Field 8: variable, weather data

> I assume, though I am not told anywhere, that this is a frame that I build
> from the sensors and data I have to send, in the format presented under

> already done in the previous field, and not required here.

Yes.

> Field 9 1 char APRS software Field 10 2-4 chars Weather unit Both of
> these fields are shown as optional, yet if field 10 is missing, then how
> can you parse it?

Doesnt matter. If you dont care about what kind of wx station it is,
then no need to parse that field..

> But it isn't, so what DO I do with these, given that I'm not running any
> APRS software, and I'd like to send an "AVR" identifier?

Maybe use 0 for other and AVR for the identifier...

They should be as shown in the spec. I havent looked recently, but it should be obvious...

I agree that it should be obvious, even to someone who does not live and

breathe it.
Unfortunately, it wasn't.

>
> > Field 2: 7 char, "DHM/HMS"
>
>Day hours minutes

What I see, looks like HMS in Zulu time, but that dosen't match the field description at all.. If the left pair of digits were "31" then it would be obvious that it's DHM.

But then I am left with confusion over the "DHM/HMS" which implies that I can use either one. That can't be true though, since you'd have no way to know how to parse it.

> > Field 7: 7 char, wind dir and speed (as opposed to "weather data?")
>
>Wind direction and speed are part of the weather data you want to report.

Ok, but it's confusing as hell to have them here, and then call out this second field of "weather data", as if wind speed and direction are not weather data.

>
>Maybe use 0 for other and AVR for the identifier...

My point though, is that the spec says both fields are optional, meaning that I may include either, both, or none. Unfortunately, there's no way to parse that data unless the ninth field is required. It may be the case that these two fields are a set, and that I can either leave them both off, or put them both on, (which makes sense to me) but that's not what the doc says.

I'm just trying to get an accurate interpretation of the spec, and to point out areas where it is ambiguous or maybe wrong, so it can be improved.

Its DHM if it ends with a "z" or it is HMS if it ends with an "h"...

All APRS position reports have DIRECTION and SPEED in those fields. For
the Weather stations, it made sense to conserve bytes and use them for
that.

Yes. They are optional. But most of us would like to see an identifier
there as to your application so that resulting packets can be attributed
to the source... Just choose some characters that are unique to your
application as identifiers...

Bob

Good thing I asked, that's totally non-obvious from the spec!

>All APRS position reports have DIRECTION and SPEED in those fields. For
>the Weather stations, it made sense to conserve bytes and use them for
>that.

Makes sense, I'm just going at it cold, from what the spec says.
I may in fact be moving when I report, but I will un-twist the wind and
give you the same vector as if I was sitting still.

>Yes. They are optional. But most of us would like to see an identifier
>there as to your application so that resulting packets cab be attributed
>to the source... Just choose some characters that are unique to your
>application as identifiers...

No problem, but the spec should say that those two fields are "all or
nothing", otherwise you'll get unparseable frames.

It's also bad juju to parse from both ends.

There's a long story attached to that, which ended up with me finding a bug
in our code that was triggered by a bug in one of Visa's five tandem
non-stop machines. I had to write a program that simulated transactions,
and every conceivable randomized error, to prove that it was happening the
way I thought that it could.

Hi David,

Remember, too, that in a "full" report (with position), the speed is in knots. Sections 6 and 7 give the information you are looking for regarding timestamps, lat/lon format, and the dir/spd extension. Think of a "full" weather report as a position report with weather data in the extension and comment fields.

A minimum weather report consists of wind direction, wind speed, wind gust, and temperature in that order. A positionless weather packet (which, by the way, may be preferred as then you can use any icon for your vehicle in the posit) contains "c...s...g...t..." at a minimum ("..." means "not available").

A full weather packet must have a symbol code of "_", a 7 byte APRS extension of "000/000", and a minimum of "g...t..." Note that a direction of 000 means that wind speed is ignored (use 360 for North).

Speed in a positionless packet is mph. Speed in a full packet (as with any posit) is in knots. Gust speed is always mph.

Regarding the APRS software and WX unit info: don't use c, s, g, t, r, p, P, h, or b as many parsers scan the entire comment field for these characters. Also, the barometric pressure can be either 4 or 5 digits. If it is 4 digits, a bp >= 1000.0 mb loses the 1 (1018.1 = 0181, 925.2 =

9252).

Hope this helps.

73,

Pete Loveall AE5PL

Hello, List -

Who maintains these codes. Who decides when it is time to transistion from "APZxxx" to a more specific code?

Many thanks,

Jim Wagner

More or less the individual that wants it. Just pick one, and I'll see if
it conflicts with anything existing and then add it to the list.

Here is the last revision that I know of... dated Sept 2001:

APRS-WG

Bill Diaz requested APA... for his AFilter applications. Here is the
updated list of TOCALLS. I will assume this is acceptable to everyone
unless there are objections.

In response to the last time we debated this and Mike's comments, it should be noted that None of these alignments are Exclusive. They are simply reservations. If someone else wants to use a subgroup of number series, then I will try to accomodate. Notice the "etc" in each category..

This list will be updated in real time as people make Email reservations when such requests are made public and when there is no conflict. I will maintain the list and issue periodic copies on the APRSSPEC list when needed. Official action by the WG is not needed except to resolve conflicts.

- APA A-Filter, Alinco, etc
 - APAFxx AFilter.
 - APAGxx AGATE
 - APAXxx AFilterX.
 - APAHxx AHub
- APB avail
- APC Windows CE, etc
- APD APRSd, etc
- APE avail
- APF avail
- APG Gates, etc
- APH HamHud, etc
- API Icom, etc
 - APICQx for ICQ
- APJ JavaAPRS,JeAPRS,etc
- APK Kenwood, etc
 - APK0xx THD7's
 - APK1xx D700's
- APL Liunx applications
- APM MacAPRS, etc
- APN Network nodes, digis, etc
- APO avail
- APP pocketAPRS, etc
- APQ avail
- APR APR8xx APRSdos,etc
 - APRDxx APRSdata, APRSdr
 - APRKxx APRStk
 - APRS Generic, digis (obsolete. Digis should use APNxx instead)
 - APRXxx APRSmax
 - APRTLM used my MIM's and Mic-lites, etc
- APS APRS+SA, etc
- APT TinyTrack
 - APTTxx Tiny Track
 - APT2xx Tiny Track II
 - APTAXx K4ATM's tiny track

APTV for ATV/APRN and SSTV applications
APU UView, etc
APU1xx UView 16 bit applications
APU2xx UView 32 bit apps
APV avail
APW WinAPRS, etc
APX Xaprs, etc
APY etc, Yeasu, etc
APZ Experimental
APZ0xx Xastir
APZPAD Smart Palm

Due to the limited address space available, we ask that authors be conservative in their use of their address space and try to accomodate others desiring to use the same major address block where possible. If anyone needs a new series and if the subblock is already in use, then the WG would suggest that the requester coordinate with the other authors of that block to arrive at a mutually agreeable arrangement.

Requests for new addresses should be posted on the APRSSPEC list, and in the absence of any conflicts or contention, these requests will be accommodated where possible. In the event of conflict, issues will be resolved by the WG.

WB4APR, Bob

Well, as long as everyone's cognizant that APCYxx is the Cybiko version and
APC[^Y]xx is the Windows CE version.

I'll be happy to avoid the Y in the fourth character.

Anyone?

-Rob

Seems reasonable..

bob

I thought APC was totally reserved for Windows CE..

If Rob has a problems with APCY, then I would too..

However, if Rob is using APCExx and Alex uses APCYxx, then I wouldn't have a problem with it either..

I also don't have a problem with the APUxxx

=====
Hi there,

May I request to reserve the APCYxx TOCALL subgroup for my Cybiko applications?

Thanks and 73s,
--Alex

In message <LYR26815-69731-2002.03.19-15.23.46--roger#peaksys.co.uk@lists.tapr.org>, Bob Bruninga <bruninga@usna.edu> writes
[snip]

> APU UView, etc
> APU1xx UView 16 bit applications
> APU2xx UView 32 bit apps

I would also like to use APU3. (For an unproto terminal that has some APRS capabilities.)

=====

> APC Windows CE, etc

Well, as long as everyone's cognizant that APCYxx is the Cybiko version and APC[^Y]xx is the Windows CE version.

I'll be happy to avoid the Y in the fourth character.

Anyone?

-Rob

I dont think we have a very good list (or I cant find it). Can EVERYONE that is currently using a user defined format please send in your usage? Here is the only one I know about:

APRS USER DEFINED DATA FORMATS LIST (26 Mar 2001)

HEADER	AUTHOR	DESCRIPTION
{Fnn	WB4APR	nn is a 2 byte descriptor of MITELE GPS data formats
{K1	WB4APR	"K" for Keps and "1" for NASA One line.
{K2n	WB4APR	For NASA two line elements. "n" is line 1 or 2.
{}	J Bennet	for WX

W would be OK. X is in my call, Linux, and X (the latter two because I'm porting to the Linux platform). That's the only reason. If others use the data, 'W' would probably make more sense.

(This message is posted on the APRS SPEC SIG on a monthly basis.)

PURPOSE

The purpose of the APRS SPEC SIG is to provide a forum for folks interested in discussing the APRS protocol specification.

POSTING MESSAGES

To post messages to the APRS SPEC SIG, send email to aprsspec@lists.tapr.org

APRS SPEC SIG RULES

The APRS SPEC SIG has a few simple rules:

- . Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.
- . Stick to the subject, i.e., the APRS protocol specification. Subjects that are only tangentially related to the APRS protocol specification (like ≥what kind of printer should I buy to print out my copy of the APRS specification?≤) may be considered off-topic. If you start a message with ≥this is off-topica≤ then you are violating this rule.
- . Be succinct when composing a message. (The APRS SPEC SIG software has been optioned to limit the length of each message.)

- . When quoting a previous message, only quote the parts of that message you are referencing. (The APRS SPEC SIG software has been optioned to limit the length of a quote.)
- . Do not send messages in HTML or Rich Text format.
- . Do not send attachments.
- . Cross-posting is not permitted. (The APRS SPEC SIG software has been optioned to prevent cross-posting.)
- . The APRS SPEC SIG administrator reserves the right to suspend or ban any list member who violates these rules.

SUBSCRIPTION MAINTENANCE

You may make changes to your subscription (like change your email address, toggle on/off the digest mode, etc.) by logging into the APRS SPEC SIG at <http://www.tapr.org/cgi-bin/lyris.pl>

UNSUBSCRIBING

To unsubscribe from the APRS SPEC SIG, follow the directions you will find at the bottom of each message you receive from the APRS SPEC SIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRS SPEC, please email the APRS SPEC SIG administrator at the address below.

Stan Horzempa, WA1LOU, wallou@tapr.org

Hello, List...

I've just started working on query processing for easyAPRS. A clarification would really help.

The ?IGATE? and ?WX? undirected queries are all described in APRS101.pdf in the same section with the ?APRS? query. The described format says that a "target footprint" can be included. The example shows such with the ?APRS? query but not with the other two. Can the target be expected with ?IGATE? and ?WX?. I suspect so, but want to make sure.

Many thanks to all...

Hello, Spec Discussion Group -

Some details about APRSH would be helpful.

It asks the addressed station to return the number of times the sending station has been heard in each of the last 8 hours.

(1) Are those hours reckoned from the receiving time or "straight-up clock" time. That is, if the query is received at 0915 hr, would the most recent hour begin at 0900 or 0815?

(2) The example in the specs seems to use periods to denote hours with nothing heard. Why not "0"?

(3) Does this count unique packets or total packets including duplicates arriving from multiple WIDE sources?

(4) Are multi-digit hour fields allowed?

Many thanks,

Jim Wagner

> (1) Are those hours reckoned from the receiving time or "straight-up clock"
> time. That is, if the query is received at 0915 hr, would the most recent
> hour begin at 0900 or 0815?

Per clock hour. starting at 00 minutes each hour.

> (2) The example in the specs seems to use periods to denote hours with
> nothing heard. Why not "0"?

Probably not required. On the APRSdos HEARD screen, it is much easier to

see numbers out of a field of dots compared to numbers out of a sea of "0"'s

> (3) Does this count unique packets or total packets including duplicates
> arriving from multiple WIDE sources?

Totals including dupes. Gives an idea of channel load from that person.
>

> (4) Are multi-digit hour fields allowed?

Actually, the response is just a string of 8 fields with no labels of the hours. 1 3 5 . . 6 4 9

is always 8 fields long with the first digit being the present hour...

Going to the Dayton Hamvention? Then plan to attend the annual Digital*BASH sponsored by TAPR and the Miami Valley FM Association to be held on Friday, May 17, 2002!

For reservations, please contact the TAPR office as described below.

What?

An event for the digitally-inclined ham, featuring:

- * Buffet dinner (Prime Rib, Chicken, and Pasta)
- * Keynote Address (Speaker to be named)
- * TAPR special interest group meetings
- * "Birds of a Feather" gatherings

When?

Friday evening, May 17, 2002

Doors open at 7:00 pm; dinner served at 7:30 pm

Speaker and meetings after dinner

Where?

Kohler's Banquet Center, 4548 Presidential Way, Kettering
(39 40.75N, 84 08.43W), about 6 miles SE of downtown Dayton --
just off of East David Road. Detailed directions and maps are available
on the TAPR web site (<http://www.tapr.org/tapr/html/Fdayton.maps.html>)
or at the TAPR booth.

How?

Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is \$25.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing a dinner
can eat.

To register, contact:

PACK*BASH

c/o TAPR

8987-309 E. Tanque Verde Road #337

Tucson, AZ 85749-9399

Phone: 972-671-TAPR (8277)

Fax: 972-671-8716

Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?

PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio, the national leader in digital communication -- and the Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to <http://www.tapr.org/tapr/html/dayton.html#packetbash>, or send email to tapr@tapr.org.

Subject: Weather Icons

APRS spec, Chapter 12: Weather Reports, page 65 (page 75 in the PDF file) says this:

"An APRS Complete Weather Report can contain a timestamp and location information, using any of the legal lat/long and compressed lat/long position formats described earlier. An APRS Object may also have weather information associated with it.

Examples of report formats are shown below. Note that the Symbol Code in every case is the _ (underscore). Also the 7-byte Wind Direction and Wind Speed Data Extension replace the cccc and ssss fields of a Positionless Weather Report."

So... That pretty much casts in stone that weather reports should only have _ or /_ symbols (blue or green WX circles). /W and \W are not allowed by the spec.

In the symbol table though, /W and \W are for National Weather Service stations, and NWS + overlay.

So, are the \W and /W icons to be used for stations sending Complete Weather Reports on APRS? If so, the spec text is wrong.

I just tweaked Xastir to only allow _ and /_ for weather stations. If the NWS icons are intended for use at NWS _as_ weather stations, then I need to tweak the code some more, and the spec needs to be corrected as well.

Good question. My interpretation has been that NWS stations must send weather as a positionless packet if they want to send weather. The Fort Worth, TX NWS station doesn't send weather so it is not an issue here. Basically, if a station wants to use an icon other than the _ (by the way, overlays are ok), it must use separate posit and positionless weather packets.

Yes, I have always accepted /W and \W interchangeably with /_ and _.
thanks for finding the bug in the spec...

That being the case, how many other software authors besides myself (and Steve Dimse) have their software set to the spec? Since the spec has been out for a while, wouldn't it be more prudent (yes, I know you don't like them) to have the NWS stations that want to transmit weather use positionless weather packets? Or is the WG willing to modify the spec and release an update for all authors to follow?

And some small bugs at findu.com: It seems that out of these four symbols (/W \W /_ _), only some of them are parsed by findu.
>From the message I just saw it may be because Steve wrote the code with spec in hand, which is what I'm trying to do.

Another bug at findu has to do with reversed table/symbol chars in a MIC-E packet: They are parsed by findu.com and shouldn't be. With the TinyTrak-II config software it's easy to make this error and I've done so. I've seen other people do this as well.

I'm getting quite a collection of bugs, omissions, and duplications in the spec. Is there any hope of updating it in the future?

Is it time to put the spec on SourceForge so it can be updated in a reasonable timeframe and the changes tracked? SourceForge is working well for the Xastir project. It should work just as well for a spec. Anyone interested in changes to the spec as they occur could subscribe to a mailing list for just that.

I'll tweak Xastir to allow sending any of the four for weather reports, but I'll probably bring up a popup warning dialog if they select NWS icons, just to let the user know what they're really selecting.

For Complete Weather Report Format, as it exists in the spec,
there isn't an option for Xastir. What letter should we use
near the end of the weather report to specify the software?

Big 'X' perhaps? Small 'x' is listed as X-APRS (Linux).
Big 'X' could be for "Xastir (MacOS X/Solaris/FreeBSD/Linux)".
Sound reasonable? We're currently sending a 'z' in that slot.

Also, we are sending to APXyyy currently (APX112 in the latest
CVS version). We made the change to 'X' over a year ago, but
haven't seen it in any official lists yet. Can we get this
cast in stone finally?

Thanks,

Curt, WE7U archer@eskimo.com

Ok: We'll use capital 'X' near the end of the weather reports
and continue to use APXyyy as the destination address.

I'll commit the 'X' change to CVS immediately.

Thanks,

When you reply to a message on this SIG, the SIG software is set up so that you end up replying to the person that posted the message. Your reply will not be posted to the SIG unless you Reply-To-All or you add the SIG email address in the TO: field of your message.

Is this the way you like it? Many other SIGs including two others I administer are set up to reply to the SIG rather than to the person who posted the message. Would you prefer this option?

Let me know if you would prefer to reply to the SIG or reply to the person who posted the message. The majority rules!

I'd say Change it. A reply to SIG should be the purpose of a SPEC
discussion LIST.

I've seen far too many examples of where someone meant to reply personally to someone but it was sent to an entire list to think it's *never* a good idea to default to 'reply-all'. The potential for damage grossly outweighs the normal benefit.

If person A writes to the list and person B replies, but only to person A, it's easy enough for person A to privately write person B and suggest the message be forwarded to the list.

Reply to all - personal accountability and shared discussion outweigh
the potential for folks that don't yet know how to control their news
clients.

Everyone's gotta learn - sometimes with an embarrassing motivator. And
the manouvers required to purposely direct a message are minimal.

I will keep accepting survey responses until they dwindle to nothing or less. By the way, you can send your survey responses directly to me rather than the SIG.

The response to the >reply surveys< has trickled down to less than none, so the survey is now closed and the results are, as follows:

By a 2:1 margin, the folks responding to the survey prefer that replies go to the list. Therefore, I will change the settings of APRSSPEC, APRSSIG, and HTAPRS to reflect the results of the survey immediately..

By the way, the other TAPR SIGs I administer (APRSSAT and MIC-E) already send replies to the list.

Hello, List ...

I've just come to the realization that query response is more complex than it might first seem. There are all of those duplicate packets arriving by different digi paths. You don't want to respond to every one, yet you do want to respond to a valid repeat query from the same station.

So, what criterion is used to distinguish between multiple packets arriving by different paths and a repeat query? Time? If so, how long? 1 minute? 2? 5?

Many thanks to all of you...

> minute? 2? 5?

Since a QUERY sets a random 2 minute random number timer in all
respondents, then any multiple queries within that window only just
regeenerate the random transmit time and so there are no additional
responses generated unless the random response has already responded.

That is how the QUERY resposne system was designed. I have no idea if all
client software implemtented it properly.

But since a QUERY tells everyone to respond, then we sure want to minimize
those. I would say only once every 3 to 5 minteus would be about right.
what woiuld be ideal (but I didnt do it) would be to for the clients to
then respos as above, but then OBSERVE if they in fact were digipeated.
If they were, then they should not respond again for say 5 minutes ... but
if they did not hear themselves then they should be armed to respond
immediatly to the next query o rsomething like that...

Don't most widen-n digi's assume a dupe time of 30 seconds? Ie, you can't send the same packet twice in less than 30 seconds. So IMHO, all queries from a given station should arrive within 30 seconds of one another. Any greater than that, consider it two queries.

Wes

But if every station on frequency responds the first time (how many
hundred is that?) do we really want those same hundreds of TNC's all
responding to another QUERY only 30 seconds later? I strongly think not.

The original APRSdos defined the query response window to be 2 minutes or
longer..

Look like I am not to late yet for this one...

reply should go to the sender, reply all should go to the sender and the SIG.
In other words, just like it is now.

See the outrage on the other list if you need reasons.

-Jeff

P.S. A few of you voting for the default reply to go to the public SIG better
think about what you are asking for as I see some of you on APRSSIG
complaining about this very change you seem to be asking for here.

Hmmm it looks to me like right now it does not matter if you reply or
reply all it still goes to the same address. To tell you the truth I
always thought Reply All meant to sent to you whole mailing list so I
never used it. hehe But to play it save I still say us the Reply to

send to the list. If the topic gets off subject or personal then you can use the personal email address. Other wise I think others might be able to learn from discussions that list members have on the list!

Subject: [aprsspec] Re: ADMIN: replying to this SIG

Look like I am not to late yet for this one...

reply should go to the sender, reply all should go to the sender and the SIG.

In other words, just like it is now.

See the outrage on the other list if you need reasons.

-Jeff

P.S. A few of you voting for the default reply to go to the public SIG better

think about what you are asking for as I see some of you on APRSSIG complaining about this very change you seem to be asking for here.

LOL I used the reply all and got a message back stating that my message was not posted because the first line was identical to another one of my recent post. The reason for this is that by using reply all, I was actually sending the message three times to the same address. hehe I guess I was right all along to avoid using the reply all. I'm sure I can change settings someplace to fix this problem. But whatever settings I'm using are default. So I believe it is best to use the simply reply button to post messages to this SIG.

After experimenting with various combinations of SIG software settings, it is evident that the SIG software cannot be set up to reply to the SIG without losing the convenience of replying to the original author of a

message. Therefore, the SIG software is now set up to perform as follows:

REPLY sends your reply to the originator of the message

REPLY TO ALL sends your reply to the SIG and the originator of the message

Note that I provide no guarantees how these settings will interact with the settings of your email software. However, I believe that this combination of settings will work correctly with most email software.

I appreciate your patience during the past week as I experimented with the SIG software. There is no way to experiment off-line, so you all were guinea pigs during these experiments. I apologize for that.

I consider this matter closed and off-topic on the SIG. If you wish to discuss this matter with me further, please do so directly and spare the SIG.

Thanks for your cooperation,

Stan, WA1LOU, SIG administrator

We're very happy to announce that Bdale Garbe, KB0G, will be the keynote speaker at the TAPR/MVFMA Digital BASH on Friday evening at Hamvention.

Bdale is one of the long-time "good guys" in the digital radio and amateur satellite worlds. He was in the middle of the early work on KA9Q's "NET" and "NOS" programs, pioneered megabit-rate packet radio, and in the satellite world was heavily involved in the RUDAK and AO-40 GPS experiments. Back in the Old Days, he was a board member and Vice President of TAPR, and remains one of TAPR's best friends. On a different front, Bdale was just elected as Debian Project Leader, so he now oversees one of the major Linux distributions -- and the one that is by far the most ham-friendly. Bdale works in the Linux development group at HP, and in his spare (?) time does VHF/UHF/microwave contesting and roaming.

Bdale's talk will blend all of these interests into an entertaining and informative presentation titled "From Bits in the Basement to Debian -- and Back Again".

You can find more information about the Digital BASH and TAPR's other Hamvention activities at <http://www.tapr.org/tapr/dayton/>.

See you there!

73,
John

Hello List...

On page 57, near the beginning of the chapter on Objects and Items, it the spec says:

"Object Reports specify an Object's position, can have an optional timestamp, ..."

On page 58, the spec says, just above the format diagram, "An Object always has a timestamp".

Could someone enlighten me as to which is correct?

Thanks to you all,

Jim Wagner

That line is incorrect for an APRS OBJECT. But for the use of the generic
term "object" which is something on an APRS map, then it can be an ITEM
which is the same thing without a timestamp.

As the subject says... the new issue of TAPR's journal, the
_Packet_Status_Register_, is now available online. You can go to
<http://www.tappr.org/tappr/html/Fpsr.html>, or obtain it via ftp from
ftp://ftp.tappr.org/psr/Spring_83_2002.pdf. You'll need Adobe Acrobat or
other PDF file reader to view the document.

Stan Horzepa, WA1LOU, has taken the reins as the PSR's editor, and I'd like
to thank him for his great work on this issue. Please send comments,
suggestions, or -- best of all -- articles to Stan at psr@tappr.org.

73,
John N8UR

Hello Spec Discussion List -

On page 61 of the spec, there is an example of a corridor which is as follows:

;FLIGHTPTH*4903.50N\07201.75W1610/310{100}

Now, I hope I am interpreting things correctly, and it appears from the leading character (";") that this is an object. Objects are stated to require a time-stamp. This example does not appear to have a time-stamp.

Perhaps it was intended to be an item? That would change the leading character to ") ", I think. Either that, or a time-stamp should be added?

If someone else could confirm the analysis or explain why there is no problem, it would be greatly appreciated.

Many thanks,

Jim Wagner

I agree. This is not right. It either needs to be an Item or it needs a time stamp...

I assume (and hope) this item _has_ now been added to _the list_ of tasks that faces the working group in their eventual production of the next version of the APRS Protocol. Bob, you're still maintaining that list aren't you? Is anybody else helping to maintain a copy of that list?

Hi Group,
Is APRS protocol Specification Version 1.0.1 still the most recent one?

Hello, Spec List -

I have some rather practical questions about area objects.

(1) What is the orientation of the triangle(s) within the area rectangle? I would assume that the base is coincident with the south edge of the box and the apex opposite the base is at the center of the north edge. But, there are many (infinite?) number of other possible orientations. Can someone specify what the expected orientation is?

(2) What is the color of an unfilled object? Is it specified by the object color number or does that apply only to fill?

(3) In the case of filled objects, is there a contrasting outline around the outer edge of the object or does the color go right out to the vertical and horizontal extent of the object?

(4) In the color descriptions, does "low intensity" mean dark or does it mean transparent? If one applies a numeric range of 0 to 255 to each color component (a common convention), would "high intensity" red correspond to (r,g,b) = (255,0,0) and "low intensity" red correspond to (r,g,b) = (128,0,0)?

(5) What is the distinction between high intensity gray and low intensity black?

For that matter, how can one have "low intensity black" if black is the absence of any color components (that is, r,g,b = 0,0,0)?

(6) In the case of a corridor, does the corridor form a true diagonal rectangle and thus, extend outside of the extent box at each end? Or, is the corridor trimmed at the edges of the extent box such that the corridor is pointed at each end?

Many thanks to everyone...

Jim Wagner

Hello, List -

Sorry to add another to an already long list of questions, but...

(7) How is a circle fitted into an extent box if the specified extent box is not square? Is it sized as the largest circle to fit the box and then "justified" to the top and left edges of the box?

Again, many thanks....

Jim Wagner

It is an isosceles triangle with the diagonal of the BOX being the right side.

>

Yes

Probably your choice. APRSdos makes them the same.

>

Its the original 16 colors of EGA. I donno any more...

It is a full wide corridor so it is a slanted rectangle...

good question. In APRSdos, the starting point defines the northern
boundary line. The second point defines the CENTER. The radius is the
vertical distance.

I nvere noticed this u ntil you just asked, because I always click and
drag at a 45 degreer angle... So I tested it and the above is what I got.

Ignore typos...

I think this is the latest LIST of APRS TOCALLS that I have. I have added two additions if there are no objections:

APDTxx for APRS touch tone (DTMF)
APOxx for APRSpoint

This list will be updated in real time as people make Email reservations when such requests are made public and when there is no conflict. I will maintain the list and issue periodic copies on the APRSSPEC list when needed. Official action by the WG is not needed except to resolve

conflicts.

- > APZ Experimental
- > APZ0xx Xastir

> APZPAD Smart Palm

Due to the limited address space available, we ask that authors be conservative in their use of their address space and try to accomodate others desiring to use the same major address block where possible. If anyone needs a new series and if the subblock is already in use, then the WG would suggest that the requester coordinate with the other authors of that block to arrive at a mutually agreeable arrangement.

Requests for new addresses should be posted on the APRSSPEC list, and in the absence of any conflicts or contention, these requests will be accommodated where possible.

WB4APR, Bob

As I am now the curator of javAPRS, you can reduce its requirements down to APJAx. javAPRS only uses this TOCALL when it is acting as a server such as I have set up to support the example pages. I recommend that JeAPRS be reduced to APJExx, but I leave that to the current author of that package.

FYI, javAPRSSrvr (not to be confused with javAPRS) does not require any TOCALL support as it "does not exist" to the RF world. It has no IGate or client functions so it does not generate any APRS packets.

Bob - change xastir from APZ to APX. Xastir has been using APX for many
a moon now.

Xastir V1.1.2
APX112

<http://map.findu.com/kc7zru> for a live example

I just received a reject message from a spam filter somewhere out there. E-mail with a virus attached was received at that machine, and apparently came from my work address.

Since I can't get infected here through e-mail (I run Linux, not Windows!), I'm absolutely sure that this address is not sending out virus e-mail. My e-mail program does absolutely nothing with

attachments, scripts, etc.

It's likely that someone on a mailing list I subscribe to got infected with the W32/KLEZ virus (but not from me!). This virus finds addresses in the mailboxes and forges e-mail as if it came from those addresses.

Please run your virus scanners again people! Be wary of attachments, no matter who they came from.

I apologize if you get multiple copies of this because you're on more than one mailing list that I also subscribe to. I just want to keep my "good" name clean.

I've had a few of these too, looks hoax-ish.
It talks about an infected email to someone I never heard of before, and
dosen't give any details about the email that would let me identify it.
I scanned here, nothing found.. (Eudora, and common sense..)

Dale is working on APRSd and needs some up-to-date guidance..
So do I! So here are my replies to his questions based on my
current understandings:?

The RF-Inet-RF anti-loop mechanism should be checking for TCPIP and TCPXX
in the path and NOT be based on a total rejection of 3rd party packets...
(the current brute-force-dont-inject-any-3rdparty packets as a loop
filter is unnecessarily restrictive and kills all other potential uses
of the 3rd party packet as it was intended (ZIP-LAN for example)).

DISCUSSION: Dale notes that ON-AIR packet paths do not have TCPIP in
them... But Of course 3rd party messages have it in the encapsulated
path header after the "}". So, by "path" I mean the 3rd party
path, not the primary path header set in the TNC.

Yes, if TCPIP or TCPXX occurs ANYWHERE in the path of a 3rd party packet,
then THAT is the signal that it should not be taken back from RF back into
the internet. Actually if it is anywhere in the packet prior to the final
data field, then I would say do NOT inject it. With or without a *...

> Should the IGATE TNCs path have TCPIP in it?

I'd say no...

>Example From RF:

WA4DSY>APD215,N4NEQ-2,WIDE:}K4JCW>APRS,TCPIP*,WA4DSY*:@220820z3410.21N etc....

Yes, this PARTICULAR 3rd party packet should be ignored since it has TCPIP
in the 3rd party header...

> Also, is RFONLY an alternate to NOGATE or did it go away?

I dont know. Lets choose one (but I'd put them both in until we figure it
out)...

I disagree that there is a reason for 3rd party packets to appear on

APRS-IS. Even ZIP-LAN should remove the third-party aspect of the packets if they are to be transported over APRS-IS.

Not necessarily true. Most IGate software have TCPIP as a default but nothing prevents TCPIP or TCPXX to be used on RF nor forces TCPIP or TCPXX to be used on the Internet.

> > Should the IGATE TNCs path have TCPIP in it?
>
> I'd say no...

But not guaranteed.

> > Also, is RFONLY an alternate to NOGATE or did it go away?

javAPRSSrvr gives the sysop the option to filter out packets with either RFONLY or NOGATE in the header.

To clarify my position, I would like to add some more insight into my
thought process.

APRS-IS exists to provide interconnectivity between APRS RF networks.
One of the benefits of its current topology is to allow
interconnectivity of non-RF APRS clients. If, however, third-party
packets are allowed to traverse APRS-IS, those packets become useless to
the attached RF networks. The reason is the size and complexity of the
packets as they should be sent out to RF (a third-party packet within a
third-party packet). If they are sent out with the original header
simply replaced, then the meaning of the third-party packet might be
altered. If the packets are being injected from a non-RF environment,
then the injector should act in a similar manner to an IGate and not
inject third-party packets but inject the packets in their original
form.

APRS-IS server functions should be as transparent to the data as
possible. Dupe checking is a necessary requirement and requires that
the server be able to interpret the FROMCALL and, in javAPRSSrvr's case,
the TOCALL in the header. Further interpretation of the header or the
packet data can become overly burdensome. Let's keep the server
overhead to a minimum. The third-party filtering was made necessary
because some IGates pass them to the Internet from RF in error. What is
to keep those same IGates from using a VIA other than TCP/IP or TCPXX.
As long as we have to account for existing problems on APRS-IS, we need
to keep rudimentary filters such as this in place.

RFONLY is the same as NOGATE, in the APRS world. However...RFONLY is a BEACONet spec and the *only* alias used there for this function. If a software product developer wishes to have their product used in the BEACONet service, then it must recognize this alias.

Why? "Gate" means something else to the BEACONet service than it does in the APRS service. I'll explain more in a followup message a bit later but that should answer what folks were looking for originally.

By the way...RFONLY is used a *lot* by AX.25-based VHF Contest Rovers on BEACONet in order to assure they don't inadvertently violate contest rules by showing up on the Internet stream. The idea is that the

originating station should have the ability to clearly state how it wishes to have its signal processed by other stations.

Kind regards,
Ev, W2EV

Why?

3rd party is a legal legitimate pAPRS packet format for embedding packets within packets. It has ALL KINDS of applications:

- 1) ZIP-LAN packets when they get to RF
- 2) Any case of multiple applications sharing a single TNC
- 3) Any packets generated from TNC's not using KISS mode
- 4) APRStt packets
- 5) APRSdata packets serving up Satellite info
- 6) And I can think of many many more... anyplace where you want to use a TNC to serve up multiple sources of APRS packets...

I don't see why anyone would want to cripple the APRS system by insisting that only the APRSis can use 3rd party format and forceably EXCLUDE everyone else from using it. That is quite myopic... Just like with digipeater looping, the presence of TCPIP or TCPXX is the indicator that the packet has been through the APRS-IS and should therefore not be re-accepted into the system. This is the correct loop filter...

Excluding the universal 3rd party format from the IS is only a crutch and we should work away from that simplistic loop-filtering approach.

> Not necessarily true. Most IGate software have TCPIP as a default but
> nothing prevents TCPIP or TCPXX to be used on RF nor forces TCPIP or

I disagree. The APRS-IS spec (?) requires all packets that are gated from IS back to RF to have either TCPIP or TCPXX in them.

> But not guaranteed.

Then lets FIX any non-APRS-IS compliant programs...

Let me clarify why 3rd party is so valuable as a general APRS mechanism:
3rd party was DESIGNED so that any number of applications may share a
single TNC for their ON-AIR packets. Such as multiple PC's at an EOC or
event NET control tent... That means that the TNC has the path of
TNCALL>APRS,WIDE to put its packets on the air...

Now then, ANY number of laptops, or applications can be connected to the
same TNC and these ADDED applications only need to send }MYAP1>APRS:data
to the TNC to have it transmitted onto the air... Thus, the ON-AIR packet
from 4 different applications at the EOC all sharing the same TNC will
look like this on the air:

```
TNCALL>APRS,WIDE:}MYAP1>APX:this packet from application #1
TNCALL>APRS,WIDE:}MYAP2>APX:this packet from application #2
TNCALL>APRS,WIDE:}MYAP3>APX:this packet from application #3
TNCALL>APRS,WIDE:}MYAP4>APX:this packet from application #4
```

I see no reason why we should insist that the APRS-IS ignore these packets
simply because they are 3rd party. This is denying APRS a tremendous
force-multiplier for APRS capability and applications..

> APRS-IS exists to provide interconnectivity between APRS RF networks.
> One of the benefits of its current topology is to allow
> interconnectivity of non-RF APRS clients. If, however, third-party
> packets are allowed to traverse APRS-IS, those packets become useless to
> the attached RF networks.

Why? I see no reason for that to be the case...

> The reason is the size and complexity of the packets as they should be
> sent out to RF (a third-party packet within a third-party packet).

I don't think size is an issue. 3rd party packets as I foresee their main application, never have anything but a FROM>TO header in the 3rd party part. And as we improve our networks, most USABLE paths of the source TNC's will only have one hop in them. Thus an on-air 3rd party in an IS-2-RF 3rd party may only add 10 bytes or so to the packet. This should not be a problem.

> altered. If the packets are being injected from a non-RF environment,
> then the injector should act in a similar manner to an IGate and not
> inject third-party packets but inject the packets in their original
> form.

I think this might be the key. Good idea... if an IGate needs to take a 3rd party packet as above which contains a message back to its local RF, then here are the rules I would use:

- 1) If any of the headers contain TCPIP or TCPXX then ignore it!
ELSE
- 2) Discard the on-air-TNC header and retain only the 3rd party portion.
- 3) Insert into this header the ",MYGATE*,I" IGate identification

- 4) If this packet needs to go back to RF for any reason, then the IS-2-RF Igate adds the usual TCPIP or TCPXX for transmission back to RF...

(but in my opinion, the way to do this is to abandon the TCPXX/TCPIP portion of the path, and simply mark the "I" with a "I*" to give the SAME meaning and without the long overhead... Thus the packet would do thusly:

```
On-RF: TNCALL>APRS,WIDE:}MYAP1>APX:this packet from application #1
IS>in: MYAP1>APX,MYGATE*,I:this packet from application #1
The above packet is what everyone on the APRS-IS sees...
IS>RF: MYCALL>APRS,DIGIS:}MYAP1>APX,MYGATE*,I*:this packet from App #1
```

Here the "I*" tells everyone it has traversed the IS and that this packet should never again be re-injected back into the APRSIS...

> APRS-IS server functions should be as transparent to the data as
> possible.

Agree completely. That is why they should accept any ON-AIR 3rd party
format (that has not previously traversed the APRSIS)...

> overhead to a minimum. The third-party filtering was made necessary
> because some IGates pass them to the Internet from RF in error. What is
> to keep those same IGates from using a VIA other than TCPIP or TCPXX?

Compliance with the APRS-IS spec...

> As long as we have to account for existing problems on APRS-IS, we need
> to keep rudimentary filters such as this in place.

Agree, but only as an interim fix. We must have a plan, a goal, and we
must keep working toward that goal. The goal should be APRS-IS
transparency, and IGate APRS-IS SPEC compliance... Saying that we will
never allow 3rd party packets to traverse the APRS-IS because it is broken
should not be driving our future designs and new software.

I agree that new software has to have patches due to the existing
problems, but this should not prohibit it from attempting to implement the
proper implementation so that APRS-IS can live up to its full potential in
the future...

I like your idea of preserving only the 3rd party part of the packet
though the IS...

Bob

> 1) ZIP-LAN packets when they get to RF

If they become 3rd party when they hit RF, why should they be gated back through APRS-IS?

> 2) Any case of multiple applications sharing a single TNC

I have multiple applications using a single TNC and third-party packets are not used. Third-party packets, by definition, are packets that are being regenerated from another medium.

> 3) Any packets generated from TNC's not using KISS mode

???? My APRS+SA using a standard TNC doesn't generate third-party packets (unless they are IGate originated).

> 4) APRStt packets

I thought the intent of APRStt was to generate standard APRS packets. Why the third-party packet aspect?

> 5) APRSdata packets serving up Satellite info

Again, why does this data need to be encapsulated with an extra header (which is all that third-party packets do)?

> 6) And I can think of many many more... anyplace where you want to use
> a TNC to serve up multiple sources of APRS packets...

I disagree. Third-party packets are defined for "packets that are to be transported through third-party (i.e. non AX.25) networks, such as the Internet, and Ethernet LAN, or a direct wire connection." I fail to see how using a TNC with multiple applications causes this to occur.

> I don't see why anyone would want to cripple the APRS system

In fact, Bob, I ran an extensive study of APRS-IS this year and the only packets appearing as third-party packets were packets being improperly gated from RF to the Internet. According to Chapter 17 of the APRS specification, the only anticipated uses for third-party packets are for network tunneling and third-party digipeating.

> I disagree. The APRS-IS spec (?) requires all packets that are gated
> from IS back to RF to have either TCPIP or TCPXX in them.

As you know, there is no APRS-IS specification.

I recommend that we adhere to the APRS specification and keep third-party packets in their original intent: to provide a means for packets to be delivered from one APRS RF network to another via a non-AX.25 medium while holding the original packet's source path header and data.

While the capability to have multiple layers of third-party headers is within the bounds of the APRS specification, I would say that adding this level of complexity to APRS-IS begins to move the APRS-IS out of the domain of providing an internetworking tool between APRS RF networks and moves it into the realm of being a rudimentary AX.25 packet router. Allowing third-party packets to traverse the APRS-IS greatly increases the complexity of dupe check algorithms (you can't dupe check on the main packet header any more) and packet interpretation algorithms (same issue). If third-party packets are allowed on APRS-IS, you are essentially trying to allow multiple levels of network tunneling to be carried over APRS-IS. I can speak from experience in saying that the current architecture of APRS-IS could be greatly compromised if that were to happen.

?????? Why isn't there ANY mention of this use in the APRS
specification?

> TNCALL>APRS,WIDE:}MYAP1>APX:this packet from application #1

I thought data types and packet content would tell us what type of
application is sending the packet, not trying to bury it under a
third-party header. The term "third-party" means someone or something
"other than the principals". In your example, application #1, #2, etc.
are all principals and should be identified as such.

> Why? I see no reason for that to be the case...
>
> > The reason is the size and complexity of the packets as

Size is not the issue, see my other post regarding this.

> I think this might be the key. Good idea... if an IGate
> needs to take a
> 3rd party packet as above which contains a message back to
> its local RF,
> then here are the rules I would use:

If it is to be gated back to RF, you need to follow the spec: add
another layer of third-party header. Any other modification would be
changing the meaning of the packet.

What we get into here, again, is multiple levels of tunneling. Now, if
the thought is to only allow one level of tunneling, then all IGates
should gate only the data after the } to the Internet. If the IGate
wants to filter TCPIP and TCPXX, fine but since there is no
specification mandating this, it might be problematic.

I honestly feel that if you try to introduce multiple levels of
tunneling into the current architecture of APRS-IS, you are asking for
trouble. Doing the above at the Igate would keep APRS-IS within its
original intent of APRS RF-Internet-APRS RF connectivity and provide
reasonable loop prevention through dupe checking. The APRS-IS servers
would still filter } data types to prevent errant data from "upsetting
the apple cart".

> Compliance with the APRS-IS spec...

There is no APRS-IS spec.

> be gated back through APRS-IS?

Because the APRS-IS is supposed to have a copy of every APRS packet transmitted on RF anywhere. If these RF 3rd party packets are not accepted by the APRS-IS, then no application sharing a common TNC and using 3rd party format can communicate with anyone else via the APRS-IS.

> > 2) Any case of multiple applications sharing a single TNC

>

> I have multiple applications using a single TNC and third-party packets

Agree, simply use KISS and this is easy..

> Third-party packets, by definition, are packets that are
> being regenerated from another medium.

I defined 3rd party packets back prior to the APRS-IS, and the definition is a packet carried within another packet. There is no such definition as you quote above... But looking at the wording that Ian used in the APRS spec, I can see how you interpreted it that way...

> > 3) Any packets generated from TNC's not using KISS mode

> ??? My APRS+SA using a standard TNC doesn't generate third-party
> packets (unless they are IGate originated).

Opps sorry. Sloppy on my part. I meant any "multiple-source packets"...

> > 4) APRStt packets

>

> I thought the intent of APRStt was to generate standard APRS packets.
> Why the third-party packet aspect?

Since every APRStt packet will have a separate ORIGINATOR callsign, then it must be injected onto 144.39 as a 3rd party packet if, say, a Kenwood D7 is being used as the interface to 144.39. And since APRStt is designed as a special event support, meaning portable, then the Kenwood is a prime component. At every Venue in Dayton, I took my APRStt laptop and two Kenwood HT's and we had APRStt DTMF conversion everywhere I went... I envision it being used that way.

> > > 5) APRSdata packets serving up Satellite info >

> Again, why does this data need to be encapsulated with an extra header

So that each one can pass through a NON KISS TNC...

One side of the TNC is a wire, the other side is APRS. If you have multiple sources of packets on the wire, then you have to either use KISS protocol, or 3rd party format.

> In fact, Bob, I ran an extensive study of APRS-IS this year and the only

> gated from RF to the Internet.

Of course. It is impossible to see 3rd party packets by using the APRS-IS as a monitor because all IGates are currently filtering out all 3rd party packets. That is why I want to slowly change that...

> According to Chapter 17 of the APRS
> specification, the only anticipated uses for third-party packets are for
> network tunneling and third-party digipeating.

Poor choice of words. Those words were not meant to be exclusive. Notice that "direct-wire-connection" is included. In the context of the spec, a TNC that is putting out multiple packets from multiple sources as 3rd party packets, is "digipeating" these packets from its serial port (wire) to its RF port...

> > The APRS-IS spec (?) requires all packets that are gated
> > from IS back to RF to have either TCPIP or TCPXX in them.

Yep, its time to fix that.

> and data.

I agree completely. But be careful of reading too many restrictions into your interpretation. There is nothing that requires an RF network on both ends. I agree with you completely that we should be following the spec. and that means that 3rd party packets are a general purpose mechanism.. and should not be used as a simplistic approach to prevent looping on the

APRS-IS.

No, that is why you proposed the perfect solution which I like. Any 3rd
party packet accepted by the APRS-IS, strips off any layers of any
carrying TNC headers and only accepts the original packet itself...
This needs to be fully thought out, but seems like the approach we need to
take...

This is an incorrect interpretation. The TNC is the "principal" since it is the LICENSED RF transmitting station. It is "carrying" another application's packet as 3rd party traffic...

[regarding stripping off any multiple headers and only forwarding the original packet...]:

> If it is to be gated back to RF, you need to follow the spec: add
> another layer of third-party header. Any other modification would be
> changing the meaning of the packet.

We both agree completely here. Any packet going from IS-2-RF needs to use 3rd party as we have been doing for years. But this is not "another" layer as you suggest above, because the first layer was already removed at IS-injection (as you suggested)...

> What we get into here, again, is multiple levels of tunneling.

Not at all. Any packet that goes through the network ONCE will never go

through it again. How do you get multiple levels of tunneling?

> Now, if
> the thought is to only allow one level of tunneling, then all IGates

Ah, Yes, that is what I thought you proposed and I think it is the right approach. The absence of an APRS-IS spec that mandates the use of "TCPIP" and "TCPXX" does not in any way detract from the fact that it **is** mandated... and must be in all IGate code...

> I honestly feel that if you try to introduce multiple levels of

if you mean by "filter" the stripping off of the on-air-TNC-shipping-header but then accepting the original packet into the IS, then we are in full agreement...

> > Compliance with the APRS-IS spec...
>
> There is no APRS-IS spec.

Ah!, There IS an IS specification..., it is just that no one has written it down! ;-) <grin>

On the subject of NAD27 to WGS84 map conversion, Richard Holbert wrote:

> So, let's define the new field as the datum field, and stick WGS84 in it
> after it's been converted. Can you send me an example of the new header
> format with WGS84 in its proper place?

It is the field that says "reserved". Just put "WGS84" in that location
as the indicator that it has been converted... The source data for all
automatically generated APRSdos maps was the USGS DLG data which I think
was all NAD27? Here is the header on ANY APRSdos map:

```
63 ,LAT ORIGIN
140 ,Long ORIGIN
18 ,pixels-per-degree
37.00416 ,      Latitude of map center (to be put in MAPLIST)
96.99898 ,Longitude of map center (ditto)
2060 ,Map Radius      (ditto)
0 ,reserved
LineFormat
9,4.... map data for the rest of the file...
```

The origins of the DLG data predated the widespread use of NAD83, so you're correct in assuming they were NAD27. Also, some of the early SDT-format data were NAD27. USGS is updating their current offerings on an as-effected basis to NAD83, with recent adjustments (which means that NAD83/1990 and NAD83/1999 are likely different in true position by the degree of tectonic motion for a given coordinate set.

On Thu, 23 May 2002, Steve Dimse wrote about 3rd party packets:

> No, I think the original intent of Pete was right. If you are going to
> be injecting the packets that came off of the LAN network, they
> should be sent in a non-third party format, instead of sending:

Ah, but the ZIP-LAN is nothing but the wires connecting the serial ports of several laptops to one TNC. There is no way to get to the APRS-IS from there. There are just 4 laptops in a tent all hooked up to a TNC. Everything they do is on RF. My only point is that because the packets that come out of the TNC are in 3rd party format, the current APRS-IS that hears them on the air, ignores them... Thus, this Tent and all its packets "don't exist" in the APRS-IS domain...

> TNCALL>APRS,WIDE:}MYAP1>APX:this packet from application #1
>
> the application should send:
>
> MYAP1>APX:this packet from application #1

But we cannot do this from 4 different laptops all connected to a single TNC without going to KISS and or a whole additional layer of hardware, firmware, software, Gateways, LANS or whatever and special configuration of same.... All that stuff is what 3rd party format avoids.

> This way there is no need for IGates to get involved.

Agree. IGates are not involved. Unless the goal of an IGate is to pass to the APRS-IS everything that is happening in an area on RF... (which I think of as its main goal...)

Again, it's a small problem. I don't want to upset the apple cart. But in the long term, we must get away from using "3rd party" rejection as the sole means of eliminating APRS-IS looping.

We must focus on the modification of APRS-IS path headers to make it 100% reliable that the presence of "TCPIP" or ",I," or ",I*," or ",I:" is the first layer reject filter for looping... not 3rd party...

Which of course means we have to get all APRS-IS authors to start doing that... :-)

That is my only point.

Bob

This is where, I think, at least Bob and I agree.

Third-party packets should only appear on AX.25 networks.

Gateways to non-AX.25 networks should strip the AX.25 information from the third-party packets before forwarding to the non-AX.25 network.

Chapter 17 of the APRS specification should be closely followed when generating third-party packets:

TNC-2 Format-> Source Path,Network ID,Gateway*:packet

Of course, the AEA format can be used as well. The source path is from the receiving end, the Network ID & Gateway is from the gateway putting the packet back into an AX.25 network. TCP/IP (for verified stations) and TCPXX (for non-verified stations) are to be used for the Network ID for packets gated from the Internet. TCPXX packets can be gated to RF, but it is the responsibility of the IGate operator to make sure they adhere to individual country third-party traffic rules.

Based on this thought line, APRS-IS servers can continue to block third-party packets to reduce loop problems introduced by errant IGates. IGates should gate ALL third-party packets from RF to APRS-IS except for third-party packets with TCPIP or TCPXX in the third-party header. Gated third-party packets should have the AX.25 headers and the } data type removed.

This methodology prevents nesting of third-party packets, leaves the current APRS-IS intact, and permits future experimentation and expansion of the APRS network.

73,

Many new Laptop computers do NOT have serial ports. Many do have built in
802.11b. That latter works great with APRS, allowing the sharing of a TNC
with multiple computers, and no wires attached. The KIPSS program talks to
a TNC in Kiss mode. Client programs can connect via TCP/IP, locally on an
802.11b network, or across the world via the Internet. Each packet is
transmitted in this format:

MYCALL>MYTO,MYPATH:MyData

> > TNCALL>APRS,WIDE:}MYAP1>APX:this packet from application #1
> >

It is not that difficult. Ziplan is difficult if you don't have a serial
port.

I am in favor of going gating IS data to RF in a non-3rd party format. But
it would take years, IF EVER, before one can remove the current filtering of
"3rd party" packets.

One other thought that Bob brought up that I, in principle, I agree with. I have always thought that the IGate injecting the packet into APRS-IS should be identified in the header. If we use the third-party header principle, the source header gets truncated to the "last digi" or where the * is. If we use Bob's idea and have the injecting IGate do this truncation and then add its own callsign-SSID,I*, we would have a complete history of a packet, no matter how many times it makes it to RF and back.

For instance, lets look at a bad example:

```
AE5PL>APRS,AE5PL-11*,WIDE3-2,WIDE3-3:rest of packet
Gets gated into the Internet by AE5PL-10:
AE5PL>APRS,AE5PL-11,WIDE3-2,AE5PL-10,I*:rest of packet
Gets gated to RF by KC5G0I:
KC5G0I>APRS,WIDE2-2:}AE5PL>APRS,AE5PL-11,WIDE3-2,AE5PL-10,I,TCPIP,KC5G0I
*:rest of packet
Gets gated back to Internet by K7PW:
AE5PL>APRS,AE5PL-11,WIDE3-2,AE5PL-10,I,TCPIP,KC5G0I,K7PW,I*:rest of
packet
```

Now, I know this should never happen. I am just using it to illustrate how the packet header is carrying a complete history of the packet route using this method of injecting IGate identification.

Food for thought.

No question that there are many many ways to work around and use new hardware. I would never expect someone else to use 3rd party format where there are shorter alternatives. But APRS is not going to be the kind of system where we instantly obsolete all older ways of doing things each time everyone rushes out to buy the latest Bill Gates gizmo...

> It is not that difficult. ZipLan is difficult if you don't have a serial

> port.

So dont use it. But we should not insist that because someone with a new toy cannot use it that therefore we are going to make sure that no one else can either...

> I am in favor of gating IS data to RF in a non-3rd party format. But
> it would take years, IF EVER, before one can remove the current filtering of
> "3rd party" packets.

Well, to clarify some confusion maybe, I never was opposed to using 3rd party for IS-2-RF. I'm the one that suggested it in the first place. I am only asking that in the future we not then depend on 3rd party filtering as the only means for preventing APRS-IS looping. LOOP detection should be based on PATH and all APRS-IS to RF packets should contain an indication that they came through the APRS-IS. That is what should be the filter trigger....

As you have probably seen in other email, our discussions have arrived at a solution that is fully backwards compatible, yet allows 3rd party packets (only the internal part) to be accepted by the APRS-IS.. this should make this issue moot...

Yes, I want to make sure that nothing we do now locks out the potential
for APRS-IS transparency in an AX.25 header. That is, the APRS-IS is just
another digipeater....

> modified to include the SOURCE of the injecting IGate. Assuming MYGATE
> is the callsign of any given IGATE, this is done by inserting
> ",MYGATE*,I" on the end of the path.

This is easy to do for standard TAPR-2 Headers, but a pain to do for AEA headers, so authors might consider just doing it for TAPR-2 headers and not worrying about the minority of AEA headers for now.

THIS seemingly lack of thoroughness is really a brilliant short cut, since not doing the AEA is no difference than what we have now, and by avoiding that extra work, and taking the trivial case of TAPR-2 headers first, that will get us 95% of the way toward IGate identification easily...

I notice that most IGate software is doing this now. We need to get the remainder to incorporate this very valuable technique for the future of the APRS-IS...

True about the AEA headers. They can be a pain. However, since most IGate software already accounts for AEA packets, the insertion algorithm shouldn't be too difficult. In fact, it is outlined in the third-party header description in chapter 17 of the spec.

I recommend inserting MYGATE,I* instead of MYGATE*,I. The reason is what is done at the return to RF end. At the Internet to RF end, according to the spec, the path is to be shortened to the last digi. In my case, that would preserve the I whereas in you case the I would be dropped.

I also think, as I showed in my example, that the path should be shortened per the third-party header spec at the source end before appending ,MYGATE,I*. This will reduce path lengths in the third-party header and no information is lost regarding the history of the packet's traversal.

> that Bob's filtering proposal won't work!

I think I disagree completely with the conclusion as stated.

My filtering proposal will work, if implemented properly. But of course it won't work until the "garbage-in" is fixed, and this will be a long term project. We must have a long term goal to fix the garbage on the APRS-IS.

In the context of the statement "it won't work", I can agree that "no single flip-switch-instant-gratification-one-person-implementation will work the instant it is activated until the "rest" of the implementation is in place first...

I am trying to help us define the "end-goal" so that we can start designing towards that goal and so that at some point in the future, we have all the pieces in place so that we can "flip-the-switch" and it will work...

To date, I have seen no successful effort by the authors of IGates to agree to a workable end goal other than the ",MYGATE,I" construct as a first step. Until we have a known end objective, that all authors can strive towards, the APRS-IS will continue to add entropy until it ceases to work.

The steps toward that end objective that I have seen that would work are:

- 1) Doing IGate identification (,MYGATE,I)
- 2) 100% adherence to insertion of either TCPIP or ",I" in all IS>RF pkts
- 3) Filtering based on TCPIP, TCPXX, and ",I"
- 4) Notice that you can RETAIN the 3rd party filter because we have now arrived at the solution of accepting only the payload of a 3rd party packet into the IS (after the #2 loop filter above)
- 5) Once all that is in place, then we flip-the-switch and the servers will no longer circulate any APRS-IS packets not in compliance.

Any devils in the details?

The problem of "TNC2" frame headers and "AEA" frame headers, of course only occurs when using a TNC in terminal mode. It's not hard to parse "AEA" frame headers into a TNC2 compatible format before passing them to the internet.

>I recommend inserting MYGATE,I* instead of MYGATE*,I. The reason is
>what is done at the return to RF end. At the Internet to RF end,
>according to the spec, the path is to be shortened to the last digi. In

This was discussed at great length a few months ago. You don't need a '*' . All these indicate that the frame has gone through an IGATE:-

MYGATE,I

MYGATE*,I
MYGATE,I*
MYGATE*,I*

So why not use the first? That way you don't create an invalid "TNC2" frame header. E.g. this is an invalid "TNC2" frame header:-
G4IDE>APRS,RELAY*,WIDE,MYGATE*,I

(Careful path shortening will also nearly, but not quite, get round the problem.)

On Fri, 24 May 2002, AE5PL Lists wrote:

> I recommend inserting MYGATE,I* instead of MYGATE*,I....

I agree completely that when a packet "arrives" to an end IGate "from the APRS-IS, that the I* should be marked to show that the Internet was the source of the packet. I believe this strongly. And equally, I believe that an RF packet injected into the APRS-IS should be injected *without* the "*" mark (that-is, a naked ",I") because at that point it has not yet traversed the APRS-IS.

The thing we must determine is exactly what "process" is the one that actually flips the "naked,I" to an ",I*".

I think it should be the IGate that is monitoring the APRS-IS. The instant it takes a packet from the APRS-IS stream is when the "naked,I" becomes a ",I*". This is totally consistent with the definition of a "*" in a TAPR-2 header. It is marked when it is "received" to show HOW it was received....

Thus, IGates injecting a packet into the APRS-IS should not pre-mark it with ",I*" since that violates the principle of least astonishment relative to TAPR-2 convention. Marking it with a "naked,I" means "this packet is intended for the APRS-IS", not that it actually got there... We can only know that it got somewhere (that is, traversed the APRS-IS) when it comes back out. That is when it should be marked with a ",I*".

And furthermore therefore, the ",MYGATE*,I" should be marked with a "*" when that IGate puts the packet onto the APRS-IS. At that instant is when the packet was actually processed by MYGATE. Thus an injected packet should have a MYGATE*, followed by a "naked,I" showing the next hop pending.

> I also think, as I showed in my example, that the path should be
> shortened per the third-party header spec at the source end before
> appending ,MYGATE,I*.

This can be a separate issue. I think I agree, but I don't want to boggle down the fundamental construct with the devils in the details.. <grin>. My initial thought is to only bring in the path-reducers when the path actually exceeds the limit. I think the future APRS network with WideN-N and smart-digi routing will see much shorter headers in general, and more IGates with shorter paths and so I don't want to start throwing out path data until we have to. I envision the following as the typical future path:

W4XX>APRS,MYDIGI,WIDE2-2:my packet stuff <== original RF Packet

W4XX>APRS,MYDIGI,WIDE2-2,MYGATE*,I*:my packet stuff <== in APRS-IS

If it goes back to RF then it would be carried by this header:

DXGATE>APRS,DIGX,WIDE1-1:}above packet goes here...

And eventually (someday) I would like to see it simply be a KISS packet:

W4XX>APRS,MYDIG,WIDE3-2,MYGATE,I,DXGATE,DIGIX,WIDE2-1*:my packet stuff

That is a 7 hop path which identifies the SOURCE RF digi, the MYGATE injection point, the DXGATE extraction point, the destination SOURCE RF DIGI and the paths at both ends. THAT IS MY DREAM.

Notice that this packet only appears on RF ONCE in its long form. and that is ONLY at the end delivery point, and this is ONLY for rare IS-to-RF end user delivery.

FURTHER! If the packet was originally heard by the first IGate from the first MYDIG* then the following WIDE3-3 would be dropped. Once a packet is heard, all subsequent unused path junk CAN be dropped. And I think we eventually should have an IGate monitoring ALL digis so that we do get these on the first hop. AND in that case, the final WIDE2-1 is not needed either! Thus the "typical" end-to-end APRS packet would look like this:

W4XX>APRS,MYDIG,MYGATE,I,DXGATE,DIGIX*:my packet stuff

Which is sure sweet. Full path details end-to-end...

This is what drives every comment I have made over the last few years on the topic of APRS-IS. I am not trying to say lets do this end-for-end stuff now. But I am fighting hard to make sure that we don't do anything NOW that would PREVENT us from moving to this in the future...

And this is why we MUST eventually get away from using the 3rd-party-crutch filter as the only means for loop detection. It prevents us from ever going to KISS packet regeneration at the distant end!

Without detecting "TCPIP" or "I" as a primary means of loop detection, we will forever be denied the ability to use KISS mode to regenerate packets from the APRS-IS..

> frame header. E.g. this is an invalid "TNC2" frame header:-
> G4IDE>APRS,RELAY*,WIDE,MYGATE*,I

Sorry, Roger, I disagree completely. The reasons are many:

- 1) Consistency with the function of the AX.25 has-been-digipeated-bit.
- 2) Having multiple *'s in a TAPR-2 path is NOT an "invalid" header. It is only "invalid" if you define it that way in your own code.
- 3) The DSP-12 and possibly other TAPR-2 implementations ALWAYS display a "*" by every digi field with the has-been-digipeated-bit set.

The packet: G4IDE>APRS,RELAY*,WIDE*,MYGATE*,I is perfectly valid.

- 4) We must NOT throw away the state of the has-been-digipeated-bit when we convert an AX.25 header to its ASCII equivalent. This severely constrains our future abilities to do anything with Header data.

I say again, every digipeater in an AX.25 field has a has-been-digipeated bit, and that bit is either a "1" or a "0". We must preserve that information. It is only a "convenience" that the TAPR2 header in many TNC's drop all the *'s except the last one when converting a header to ASCII. But that is NOT a good idea. We should not follow this simplification blindly as it cripples our future implementations and throws away perfectly valid data.

PREEMPTIVE digipeating is an idea that has been around since 1994 and it is dependent on knowing what digis have been used regardless of their POSITION in the header. The only way of preserving that information when converting the header to its ASCII equivalent is the *. It is perfectly good, and it works, and it is totally consistent. If one wants to know what is the LAST digi heard, then it is the LAST * (in a conventional packet).

If your code considers a packet with multiple *'s in it as invalid, then that is only a local restriction of your code and it will not work with a DSP-12 TNC... I hope I can convince you that we must preserve the state of the has-been-digipeated-bit in all ASCII representations of an AX.25 header if we are to make any future improvements on APRS routing.

Sure, it is not "needed" "now", but why tie our hands in the future by putting in arbitrary restrictions now and accepting a process that throws away critical PATH info that could be so valuable?

On a bad day, I wake up and dream of saying the following:

"I wish that APRS never allowed any paths longer than 3 hops. APRS was designed for tactical real-time support of events and local operations. ANY event or local happening can be done by 3 hops. One to get to the BIG wide in the middle, and ONE to assure end delivery to an HT...

If 3 hops cannot do what you are trying to do with APRS, then APRS on 144.39 is not the tool for the job. Use something else.

But then I go back to sleep... and the nightmare is over. de WB4APR

> in mobile trackers and limit digi's so they only transmit their
> position/info no more than once an hour.

I oppose this last idea strongly.. Mobiles driving in new areas would never even see the digi! In one hour he covers 60 miles! The rule should be:

DIGIS send a local DIRECT packet once every 10 minutes.
DIGIS send a ONE HOP packet once every 30 minutes.

10 minutes for local and 30 minutes for "area" are the two NET-CYCLE times quoted in the spec.

I do also think a 2 hop path every hour is not a bad idea. Anything beyond that is in my opinion, just QRM...

Let's take a step back and look at what the spec says (and most IGates are already doing) and what we are proposing. Chapter 17 in the spec says that the third-party header (the header after the `}`) will be comprised of (TNC-2 format used here for clarity):

Source Path Header (without "unused" digipeaters, `*` or `:`), Third-Party Network Identifier ("callsign"), Callsign of Receiving Gateway Station (-SSID)*:

So, according to the spec, a packet that looks like the following on APRS-IS:

```
AE5PL>APRS,AE5PL-11*,WIDE3-2,WIDE5-5:rest of packet
```

Should be gated to RF as:

```
IGATECALL>APRS,PATH:{AE5PL>APRS,AE5PL-11,WIDE3-2,TCPIP,IGATECALL*:rest of packet
```

Note that WIDE5-5 has been removed, but WIDE3-2 hasn't as it indicates that one WIDEn-n digi has digi'ed the packet.

What is being recommended is the insertion of MYCALL,I at the insertion IGate (the IGate that puts the packet into APRS-IS). To be compatible with the spec for retransmission back to RF and maintain a full history of the packets route, the insertion needs to be as follows (TNC-2 format used for clarity):

```
AE5PL>APRS,AE5PL-11,WIDE3-2,MYCALL,I*:rest of packet
```

This will cause the packet to appear as the following if it is gated back to RF:

```
IGATECALL>APRS,PATH:{AE5PL>APRS,AE5PL-11,WIDE3-2,MYCALL,I,TCPIP,IGATECALL*:rest of packet
```

This tells the recipient that the packet entered APRS-IS at MYCALL and exited at IGATECALL. It also tells AE5PL that MYCALL saw the packet after being digi'ed by AE5PL-11 and one WIDEn-n digi.

As the third-party packet definition already exists and most IGates

follow it, this would be the easiest implementation to maintain routing history and filtering desired by Bob and still keep compatible with all IGates.

(Note - it is NOT invalid in my code, so there's no self-interest in my comments.)

I did not introduce the terms "TNC2" and "AEA". Part of my point is that the different frame header formats are an arbitrary feature of the hardware being used. As I said, I think all headers should be converted into one format before being passed to the internet. (That IS a feature of my code.)

However, given that you and AE5PL were discussing the situation in terms of "TNC2" and "AEA" headers, what I quoted was an invalid "TNC2" header, i.e. a TNC2 would never produce a header like that.

>3) The DSP-12 and possibly other TAPR-2 implementations ALWAYS display
> a "*" by every digi field with the has-been-digipeated-bit set.
>
> The packet: G4IDE>APRS,RELAY*,WIDE*,MYGATE*,I is perfectly valid.

If the '*' is used to indicate EVERY 'H' bit that is set, then the above is a valid header. With a TNC2 header, the '*' indicates the LAST 'H' bit set. So we now have "TNC2", "AEA" and "DSP-12" headers, which reinforces my point about the desirability of converting them all to one format.

>4) We must NOT throw away the state of the has-been-digipeated-bit when
> we convert an AX.25 header to its ASCII equivalent. This severely
> constrains our future abilities to do anything with Header data.

Not at all. My suggestion should be backward compatible with all existing IGATE implementations, and contains additional information that can be used by future implementations. This frame -

G4IDE>APRS,RELAY*,WIDE,MYGATE,I

includes all the information about the original RF path, plus the additional information about how it was passed to the internet.

In terms of future development, it constrains nothing, because any software passing it back to RF is either going to understand the last two "digs" or ignore them.

Similarly, any path analysis software looking at the internet data stream will either understand them or ignore them.

[snip]

>If your code considers a packet with multiple '*'s in it as invalid, then

>that is only a local restriction of your code and it will not work with a

See my above comment - "It constrains nothing..."

>Sure, it is not "needed" "now", but why tie our hands in the future by
>putting in arbitrary restrictions now and accepting a process that throws
>away critical PATH info that could be so valuable?

I'm not throwing away anything. All the path info is there whether or
not you put in the '*'(s). Packets aren't going to "drop off" the
internet onto RF, they are going to be gated by intelligent systems.
Those systems will either understand MYGATE(*),I(*) or they won't. If
they don't, then it is possible that an incorrect RF path would be
assumed if you put in the '*'(s).

Here is a possible solution that COULD be implemented to solve SOME of the path problems.

Have the N-N digipeater be smart enough to do adaptive hold off based upon the number of decrements in the path.

SO,

If a digi hears a packet of Wide5-5 it digipeats it immediately (it is the first digi to hear the packet).

If the second digi hears the packet Wide5-4 it then does a WAIT for x amount of time. (x being a parameter in seconds of DEAD air indicating available bandwidth). All packets would be held in y time buffer, if time y expires OR the buffer is full then it is dumped.

If the third digi hears Wide5-3 then it waits for 2x time buffer and holds that packet in it's y buffer with all the others.

ETC.....

This would self management the bandwidth and always allow people with direct access to the digi priority and still propagate packets a long way IF the bandwidth is available.

Mark Cheavens
KC5EVE

All of this is just a patch instead of having REALLY smart digi's that do what can be done and what the end user would LIKE to have.

AHub does not contain any range filters.

AFilter, on the other hand, does contain the ability to geofilter location
packets. The station must first send a valid location packet that falls
within either of the 2 available geofilters. All subsequent packets from
this station will be passed until the station moves outside the geofilters.

Regional hubs that use AFilter (generally on port 14579) can provide the
necessary geofiltering for users who wish to limit their APRS bandwidth to
stations within 1 or 2 distinct geographical areas.

A regional (geofiltered) hub can easily be implemented with AFilter and
AFilterX (multi-user extensions for AFilter).

Already had a brain explosion.....

Two paths:

1. LOCAL: Digipeater strips the path and digipeats it...LOCAL digi that hears it directly and digipeats it ONLY.
2. DIGI: First digi hears it and changes path to DIGI1
Second digi hears it and changes path to DIGI2
ETC.

By using the timers listed below (let's say timer x is 10 seconds). Then IF Digi2 has had 10 seconds of NO activity then it digipeats the first packets in it's held buffer that has not expired because of timer y (y being maybe 1 minute).

Digi 3 would then need 2x (so 20 seconds of dead air) before sending any of the items in it's buffer.

Using this method would in areas of high density make sure there is enough bandwidth for people close to EACH of the digi's AND in rural areas would make the packets go FARTHER.

In effect ALL packets would be automatically be load balanced and NO paths would have to be changed EVER while traveling. It would make ABOUT the same number of packets be visable in any area (rural area's would have packets from farther away and dense area's would have more local traffic).

The only issue I can't think decide on is the one of Priority....Example:
DigiZ hears the same packet twice (once by digiA as DIGI2 and DigiB as
DIGI3.....Should the packet be put in the 2 or 3 group of priorities.)

I think that this would REALLY help out as well with band openings. It
would always give direct heard higher priority with it's hold off timer.

> format.

Yes, and I have always wanted all has-been-digipeated bits to be indicated
with a * so that we do have an unambiguous common standardized header to
deal with without any ambiguities. APRS has no requirement that path
data be processed sequentially. We must divorce ourselves therefor from

the "assumption" in most headers that prior-used fields may drop the *.

I disagree. It indicates that you heard it via RELAY*, but it only implies an intent for it to be further routed via WIDE,MYGATE,I. There is no indication that in fact, these processes have occurred.

> In terms of future development, it constrains nothing, because any
> software passing it back to RF is either going to understand the last
> two "digis" or ignore them.

We should not be building a network routing system based on assumptions and inferences and ambiguous routing indicators. Every DIGIPEATER field in AX.25 indicates TWO separate and distinct functions:

- 1) An INTENDED ROUTE,
- 2) A mark as to whether that ROUTE was used

These two separate and distinct functions must never be blurred. Notice that callsign substitution is a subset of #2. That is, that the "intended" route was replaced with an actually USED route and this actually USED route is marked with a *. I will strongly oppose any blurring of these TWO separate and distinct functions of a digipeater field no matter how we finally implement APRS-IS... The digipeater field consists of TWO items. Those items must remain separate and distinct throughout APRS, and AX.25, and APRS-IS.

> >I hope I can convince you that we must preserve the state
> >of the has-been-digipeated-bit in all ASCII representations of an AX.25
> >header if we are to make any future improvements on APRS routing.
>
> See my above comment - "It constrains nothing..."

I say it completely destroys the integrity of the AX.25 digipeater header construct and/or is a poor way to build a system based on assumed inferences and lost path usage data.

> I'm not throwing away anything. All the path info is there whether or
> not you put in the '*'(s).

No it is not. The indicator of whether or not these fields have been used or not is NOT there. From that point on, there is no way to construct whether those fields have been USED or not, or substituted. Thus they are stuck ambiguous baggage that cannot be used for any future determination as to whether they should be discarded or not..

> Packets aren't going to "drop off" the
> internet onto RF, they are going to be gated by intelligent systems.

This is, I fear, an assumption that we should never make. Intelligent systems all the time do ridiculous and unwanted things, and especially in the APRS anarchy... We must not design a system that contains ambiguities and lost usage indicators. Using digipeater fields and discarding or making no provision for whether the field has been used or not is a recipe for disaster.. (or our current stagnation).

> Those systems will either understand MYGATE(*),I(*) or they won't.
> If they don't, then it is possible that an incorrect RF path would be
> assumed if you put in the '*'(s).

That is why we must avoid assumptions and standardize on the TAPR2 header with ALL has-been-used marks INTACT. This is the only complete, unambiguous, AX.25 header ASCII conversion that we should be considering.

The reason we couldnt do this in the past was because a lot of packets were injected into APRS-IS directly from TNC's without any processing. As we now move into PARSING ALL INCOMING packets for injection to the APRS-IS, we must also strengthen and be explicit in the accounting of the has-been-digipeated-bits.

I dont disagree with you that it can be made to work without the *'s, but I just seriously question why we seem to be intent on making a system that will just "work" while throwing out perfectly good usable single BITS that are so valuable because they dont seem to meet our immediate urgent need.

I have prepared a DRAFT APRS-IS version 1.0 (through 2.0) spec. I would appreciate your input as to any version 1.0 tidbits that I may have glossed over:

<http://www.ew.usna.edu/~bruninga/aprs-is.txt>

Thanks!

<http://www.ew.usna.edu/~bruninga/aprs-is.txt>

Good work, Bob. However, there are a couple of things that should be considered about APRS-IS 1.0. First, as discussed, IGates could and, I think we agree, should pass the payload of a third-party packet into APRS-IS if that packet did not originate from APRS-IS. APRS-IS 1.0 simply says "no third-party packets shall be transported on the Internet." What this means is that no packets with a data type of } will appear on the Internet feed. Once an IGate strips the AX.25 header and } from a third-party packet, it is now "legal" to be transported via APRS-IS. Current IGates have implemented a simpler filter, which we all agree, should be less restrictive by keying on the TCPIP or TCPXX in the third-party header instead of the } data type. Of course, everything before and including the } should not appear on the APRS-IS or any other non-AX.25 network.

APRS-IS does not require that the headers meet AX.25 specifications. For example, 9 character callsigns, character SSID's, 9+ via, etc. Within the framework of a third-party packet, there is no problem with this. However, this is definitely not compatible with the idea of gating back to RF in non-third-party format. Also, a legal AX.25 packet may enter APRS-IS but not have enough room for all of the header insertions suggested to be done at the IGates and have an outbound path. I fully believe that you actually start crippling APRS-IS if you force the headers to be completely compliant with AX.25 requirements.

The third-party packet specification is a good specification from the standpoint of identifying where the packets came from. It leaves the non-AX.25 network free to support valid APRS packets that might not, after multiple different network traversals, meet the AX.25 header requirements. It also allows for more than 16 stations to exist for a single callsign in the world.

Do you really want to restrict APRS-IS to only support the restrictive AX.25 header specification? As I have said before, I like the idea of having a full path history in the packet, including the callsign of the insertion IGate. But, very quickly, you run out of via as specified in APRS-IS. You also force non-RF APRS applications to adhere to the AX.25 naming requirements. Why don't we leave this flexible, too?

It is generally agreed that APRS-IS only supports 9 letter callsign-SSID's, but most of the server and IGate code that I am aware of allows those 9 letters to be any combination of letters, digits, and/or a hyphen. You are asking a large number of APRS operators to completely rethink how they interact on the Internet.

The third-party packet is a simple, yet very effective way to allow multiple APRS networks to communicate without the burdensome

restrictions of AX.25 limits while being carried on another network. However, with those restrictions removed, it forces those packets to be reintroduced to an AX.25 network using a mechanism such as the third-party packet.

But you are blurring them -

G4IDE>APRS,RELAY,WIDE,MYGATE*,I

by any **normal** interpretation means that the frame has travelled via
RELAY, WIDE and MYGATE. In fact it has gone straight from G4IDE to
MYGATE.

[Big snip]

>That is why we must avoid assumptions and standardize on the TAPR2 header
>with ALL has-been-used marks INTACT. This is the only complete,

But what you are doing is not unambiguous, you are going to create a
frame header than lies about the RF path, unless it is analysed in a
non-standard way that takes account of the special meaning of the last
two digis.

On Fri, 24 May 2002, AE5PL Lists wrote about the APRS-IS draft spec:

> Good work, Bob. However, there are a couple of things that should be
> considered about APRS-IS 1.0. First, as discussed, IGates could and, I
> think we agree, should pass the payload of a third-party packet into
> APRS-IS if that packet did not originate from APRS-IS.

Yes, but I wouldnt call that 1.0 since it does not exist now. I call that
APRS-IS 1.2. for clarity...

>
> APRS-IS does not require that the headers meet AX.25 specifications.
> this. However, this is definitely not compatible with the idea of
> gating back to RF in non-third-party format. Also, a legal AX.25 packet
> may enter APRS-IS but not have enough room for all of the header
> insertions suggested to be done at the IGates and have an outbound path.

That is why I propose that all headers be reduced to the 7 hop model that
I proposed:

- First field: RF source digi
- 2nd field: RF WIDEn-N number of hops
- 3rd field: Injecting Igate
- 4th field: I or I* deoending on validation or not
- 5th field: IS-2-RF Igate
- 6th Field: RF-re-insertion digi
- 7th field: RF Widen-N number of hops

Every packet that traverses the IS RFend-2-RFend can fit that model.
And it gives full traceabilty.

> Do you really want to restrict APRS-IS to only support the restrictive

> AX.25 header specification?

It seems like something worth trying.

> As I have said before, I like the idea of having a full path history in
> the packet, including the callsign of the insertion IGate. But, very
> quickly, you run out of via as specified in APRS-IS. You also force
> non-RF APRS applications to adhere to the AX.25 naming requirements.
> Why don't we leave this flexible, too?

Notice that in my specification, the 3rd party format may ALWAYS be used
for all the flexibility and total of 16 possible path hops if needed. It
is never obsoleted. In fact, it is strengthened by being able to be used
ANYWHERE for any untold purpose as well as its current use.

> It is generally agreed that APRS-IS only supports 9 letter
> callsign-SSID's, but most of the server and IGate code that I am aware
> of allows those 9 letters to be any combination of letters, digits,
> and/or a hyphen. You are asking a large number of APRS operators to
> completely rethink how they interact on the Internet.

All of these constructs remain perfectly viable as they are now since the
3rd party format may forever still be used to ship any non-compliant
packet anywhere...

> The third-party packet is a simple, yet very effective way to allow

> restrictions of AX.25 limits while being carried on another network.
> However, with those restrictions removed, it forces those packets to be
> reintroduced to an AX.25 network using a mechanism such as the
> third-party packet.

Yes, and it may continue to be used that way.

What I am talking about is a compatible option for handling
all those other packets that don't need these non-compliant constructs.
Both can work independently in the APRS-IS...

How? If the packet is received as
CALL1>APRS,DIGI1,DIGI2,DIGI3,DIGI4*,DIGI5 your model will lose all of
the prior RF path to DIGI4 thereby causing CALL1 to not know how their
packet got to the Internet. If you do this stripping at the injection
point, that information is lost for good.

> > Do you really want to restrict APRS-IS to only support the

But it is also weakened by saying "sometimes" an IGate will not use the
third-party format.

> All of these constructs remain perfectly viable as they are
> now since the
> 3rd party format may forever still be used to ship any non-compliant
> packet anywhere...

But then you are saying that the IGate using packet regeneration must
also support third-party format. If that is the case, why bother
increasing the complexity of operations which packet regeneration would
do. Why not stick with a simple, straight-forward approach which you
already have with third-party packets?

> What I am talking about is a compatible option for handling
> all those other packets that dont need these non-compliant constructs.
> Both can work independently in the APRS-IS...

But you are increasing the complexity of the IGate tremendously. And if
the IGate that is doing the packet regeneration must also do third-party
packets, where is there any gain?

Ah, but that is why I want to change it. Your example above is the crippled TAPR2 version I want to fix by moving towards the standard that ALL has-been-digipeated bits are marked always in ASCII path representations and standardize on that. APRS does not require and in many cases does not use sequential HOP processing. We must preserve the has-been-digipeated bits (shown as a *) to keep up with APRS and not be tied into the point-to-point legacies of 1980's connected packet.

> >That is why we must avoid assumptions and standardize on the TAPR2 header

> non-standard way that takes account of the special meaning of the last
> two digis.

I guess I dont follow your example. The standard I want is that ALL ASCII headers forwarded into the APRS-IS will have either a * meaning the path was "used" or not, indicating it was an unused path. Then we can strip off unused paths if we want for brevity...

Again, the reason we have this golden opportunity now is that ALL authors seem to agree that we must pre-process headers going INTO the APRS-IS and can no longer afford to just accpet ANYTHING. We have to process the header anyway to insert the MYGATE*,I so we may as well take the best, non-ambiguous method at this point and all agree to use it.

I propose the standard that all ASCII path headers are in TAPR2 format including the marking of ALL has-been-used bits with a *. This is part of APRS-IS version 1.1. I agree with you completely that what we are using now, the classic TAPR2 version with suppressed *'s is completely ambiguous. Thus we must move on.. and use an unambiguous standard...

Thanks.

Bob

> point, that information is lost for good.

I don't follow your example at all? Where are you talking about "received as"? If you mean at the injection point, then the above packet "could" be stripped down to only DIGI1*,HOPS4*,IJGATE*,I going into the APRS-IS. It retains everything I need to know:

- 1) Where the packet entered the RF system (DIGI1*)
- 2) How many hops it took to get to the IGate (HOPS4*)
- 3) What IGate injected it into the APRS-IS (IJGATE*)
- 4) And the fact that it was then injected into the APRS-IS (,I)

Now at the other end, (remember, 3rd party format may still be used...) OR, the RGATE that passes it back to RF can use KISS mode and put it back on RF as follows:

```
FROM>TO,DIGI1*,HOPS4*,IJGATE*,I*,RGATE*,DIGIz,WIDEn-N:data
```

This path arrives with all of the important parts of its path history intact... and it is a fully compliant AX.25 header to boot...

> I don't understand why you want to reduce the flexibility of APRS-IS.

I think you are still completely missing the point. I am not reducing the flexibility, but expanding it!. ALL of the old formats are still possible. The old 3rd party format may continue to be used as long as anyone has a need for it. I am only coming up with added flexibility to allow other processes (that are more efficient) to work also... The 3rd party format is still allowed as we have previously discussed and in fact is strengthened because it can be used incoming too...

> But it is also weakened by saying "sometimes" an IGate will not use the
> third-party format.

What is that a weakening? It is a strengthening of the APRS-IS to handle both...

>

Because EVERY APRS process should support 3rd party anyway. It has allways been a fundamental part of APRS and I think everyone does already support it.

> If that is the case, why bother increasing the complexity of operations
> which packet regeneration would do. Why not stick with a simple,

Because it is not increasing complexity, but the opposite. What is simpler than using KISS to regenerate a packet and eliminate the overhead of packets within packets?

> > What I am talking about is a compatible option for handling

Because the current system is broken and is falling apart with no source accountability and with ever increasing entropy. Anything worth doing is not necessarily supposed to be the easiest way. I think it is time to move out with an improved system.

But it does not provide a true routing history of the packet. If someone wanted to reduce the dependence on generic digipeating to message with someone, your method precludes that from happening. It also puts a stumbling block in the way of people trying to create routing devices or applications for APRS.

> Because it is not increasing complexity, but the opposite. What is
> simpler than using KISS to regenerate a packet and eliminate
> the overhead
> of packets within packets?

But you ARE adding a layer of complexity by now saying there are two ways for a packet to be reintroduced into the AX.25 world. And, you are adding complexity for the reintroducing IGate to differentiate between those packets that can be regenerated and those that can't. And what overhead do you save? The FROMCALL of the IGate and a } data type? I don't think 10 bytes is worth the added complexity you would be introducing.

> Because the current system is broken and is falling apart
> with no source

> accountability and with ever increasing entropy. Anything
> worth doing is
> not necessarily supposed to be the easiest way. I think it is time to
> move out with an improved system.

How is it broken? There are problems, yes. But your proposal of adding another layer of complexity does nothing to fix those problems. The problems are primarily related to IGate software which do not handle current packets properly. The APRS-IS system is finally beginning to stabilize. Worldwide communication between local RF environments is possible. Let's push to have the IGate authors fix what they have today. Let's not try to force them into trying to account for another layer of complexity which would remove routing information from the header.

Adding the ",MYCALL,I*" at the injection point to a header after trimming non-used digis is a nice enhancement for traceability. Trimming out used digis reduces traceability and renders routing algorithms useless. Nothing is gained by using KISS to regenerate a packet if the IGate still needs to interpret the packet and possibly send it as a third-party packet. And, nothing is gained by using KISS if the RF path desired takes more than 2 distinct hops.

On the surface, KISS packet regeneration is a good idea. However, when the ramifications of the increased complexity of IGates having to interpret 2 different types of packet routes, of reduced routing information, and of maintaining support for non-AX.25 compliant headers is accounted for, I don't think 10 bytes of packet overhead is worth it.

By the way, IMO IGate software is currently the most complex and difficult APRS application to write. The IGate authors have had to "make it up as they go" for the most part and the logic is not trivial. I think they have done an excellent job of getting their software to play well under the varied environments that exist. I do not want to see their job made harder by adding more variables into their already complex equation.

I would say that 90% of the problems seen on APRS-IS have been IGate caused (mangled packets, Mic-E conversions, etc.) and improper server configurations (servers randomly interconnected, using wrong ports, etc.). The first is being actively worked on by the IGate authors. The second gets worked on as they occur. I am attempting to help avoid the second with javAPRSSrvr by doing the initial configuration for each user. I also make sure that it goes to a licensed ham for verification purposes.

If I understand how things work now, it appears that Internet Stream validation could be accomplished simply and effectively, without the need for massive overhauls of the client-side software.

Think through a system whereby the frame validation takes place at the Internet Server. All Internet traffic flows through them anyway, right? It seems like a natural place to implement it and has the added advantage of not affecting any existing client-side software systems.

Then again...I may be restating a solution that was previously considered or thrown away for reasons I'm unaware of.

Ev Tupis, W2EV

There is a great value in knowing where a frame entered and exited the IStream. Please, as the discussion on validation continues, keep in mind that it would be good to assure full path-auditing.

```
Launched                : WB4APR>RELAY,WIDE5-5:...
1st Digipeat            : WB4APR>DIGI1,WIDE5-5:...
2nd Digipeat            : WB4APR>DIGI1,DIGI2,WIDE5-4:...
IGATE RX'd and passed to IStream: WB4APR>DIGI1,DIGI2,IGATE,WIDE5-4:...
RGATE sends IStream frame to RF : WB4APR>DIGI1,DIGI2,IGATE,RGATE,WIDE5-4:
```

Also...include logic to avoid unanticipated violation of AX.25 protocol:

Launched: WB4APR>RELAY,TRACE5-5:...
Digipeat: WB4APR>DIGI1,TRACE5-5:...
Digipeat: WB4APR>DIGI1,DIGI2,TRACE5-4:...
IGATE : WB4APR>DIGI1,DIGI2,IGATE,TRACE5-4:...
RGATE : WB4APR>DIGI1,DIGI2,IGATE,RGATE,TRACE5-2:...

^

Modified by RGATE to assure a max
of 7 'hops' to assure no violation of
AX.25 protocol.

Digipeat: WB4APR>DIGI1,DIGI2,IGATE,RGATE,DIGI3,TRACE5-1:...
Digipeat: WB4APR>DIGI1,DIGI2,IGATE,RGATE,DIGI3,DIGI4,TRACE5:...

Simply stating a need. There are probably many ways to do it. :o)

Kind regards,
Ev, W2EV

Validation already takes place at the APRS-IS server. The issue is regarding the validation algorithm being public domain.

Ev,

The AX.25 limit of 8 callsigns in the path is not an issue today as packets are gated to RF using third-party packet format. Third-party packets allow the AX.25 restrictions to be adhered to on both RF sides, but allows the flexibility to add the IGate information you seek into the third-party header (see chapter 17 in the spec). The IGate that gates to RF is already identified per third-party packet rules.

I just connected to AHubEast, and in 30-seconds had a ton of APRS stations
on my map. I double-click on a station in California and this is what I get
for a path:

KE6NYT-14>GPSLK,RELAY,WIDE,WIDE,WIDE:

\$GPRMC,022131,A,3411.942,N,11911.128,W,000.0,262.4,260502,014.1,E*68

>From the raw data, had I not been attached to the AHubEast, I'd think that
the band was open coast-to-coast. I see a callsign, no call
substitution...as far as I can tell, this frame made it from California to
NY -- simplex.

If the IStream path is preserved somewhere, how do I get to see it?

Asking from ignorance.

Ev, W2EV

This part of the discussion, I thought was trying to address how we handle the fact (that we all agree) is that there just will never be enough room to keep the entire path intact end-to-end or the packet becomes so long as to be impractical. I agree completely that I would like to see the entire path, but in practical terms, I see that as impossible. SO my idea above is simply my offering of a way to preserve the most important part (the entry points and number of hops) and move on...

So what are you saying? We just dont do anything and leave the system as it is? I agree that I am adding something to the system. So?
I see lots of benefits out of it, I dont see that you are necessarily pointing out any problems with it, other than it is adding an additional construct... So?

> How is it broken? There are problems, yes. But your proposal of adding
> another layer of complexity does nothing to fix those problems.

It sure seems to me like it has the potential to fix all the problems if we figure out how to do it right...

> The problems are primarily related to IGate software which do not handle
> current packets properly. The APRS-IS system is finally beginning to
> stabilize. Worldwide communication between local RF environments is
> possible. Let's push to have the IGate authors fix what they have
> today.

That is exactly the probelm I am trying to fix. The problem is that we have NO common AGREED-TO standard of how to "handle-current-packets-properly" Your statement is like the age-ole' "buy low, sell high" advice for the stockmarket... Everyone agrees 100% that that is what is needed for success in the stock market, its just that no one knows how

to do it...

- > Let's not try to force them into trying to account for another
- > layer of complexity which would remove routing information from the
- > header.

OK, so what do you propose to handle complete paths end-to-end?

- > Adding the ",MYCALL,I*" at the injection point to a header after
- > trimming non-used digis is a nice enhancement for traceability.
- > Trimming out used digis reduces traceability and renders routing
- > algorithms useless.

I thought it was a given that we cannot possibly preserve all hops end-to-end. In fact the APRS-IS currently throws away ALL source path information! So how can you argue against my proposal which preserves the important parts and insist that we stick with what we have because my proposal does not preserve ALL of it? This just does not compute?

- > Nothing is gained by using KISS to regenerate a packet if the IGate
- > still needs to interpret the packet and possibly send it as a
- > third-party packet. And, nothing is gained by using KISS if the RF path
- > desired takes more than 2 distinct hops.

I disagree with both statements. And even if nothing was gained in some unique situations, then the IGate can simply not use KISS if it thinks 3rd party is better. We are not saying that anyone needs to move to KISS. The proposal only says it will be possible.. So, dont use kiss if you dont want to. Its an option for those that want to save the 16 Bytes on RF in every APRS-IS-to-RF packet.

- > On the surface, KISS packet regeneration is a good idea. However, when
- > the ramifications of the increased complexity of IGates having to
- > interpret 2 different types of packet routes, of reduced routing
- > information, and of maintaining support for non-AX.25 compliant headers
- > is accounted for, I don't think 10 bytes of packet overhead is worth it.

Its 16 bytes or so. And all APRS software currently has to handle dozens of formats. KISS mode adds ZERO complexity, because it is NOTHING new. a KISS packet is 100% indistinguishable from any packet on the air to day. If your software can handle ANY ax.25 packet you har right now, then it already can handle ANY kiss packet. That is the beauty of it, in that it makes the APRS-IS seamless to existing protocol...

Currently, most IGates do not modify the RF->Internet headers. We have had an extensive discussion about that over the last 3 days on this SIG. It has been generally agreed that it would be good to have the RF->APRS-IS IGate trim the header per the APRS spec for third-party header trimming (chapter 17) and then append MYCALL,I*. The I* means you are seeing the packet being digi'ed by the Internet. The call preceding the I is the call of the injecting IGate.

Other than that, however, there is no differentiation between packets received via RF and packets on APRS-IS. Most client software gives you the capability to distinguish between packets received via the Internet and those packets received from RF. One of the beauties of APRS-IS is the fact that it doesn't change the packets, allowing for very clean insertion back to RF, if necessary, using the third-party packet format.

In essence, you do have a band opening. It just happens that it is via the Internet :)

No, the third-party packet format DOES let us keep the entire path intact.

> So what are you saying? We just dont do anything and leave
> the system as
> it is? I agree that I am adding something to the system. So?
> I see lots of benefits out of it, I dont see that you are necessarily
> pointing out any problems with it, other than it is adding an

You are telling the IGate programmers that they now have to parse EVERY packet for I, or TCPIP, or TCPXX, not just third-party packets. Bob, the algorithms become very complex very quickly.

> It sure seems to me like it has the potential to fix all the
> problems if
> we figure out how to do it right...

What problems does this fix? I fail to see one problem that this would address. I do see some problems it could introduce.

> That is exactly the probelm I am trying to fix. The problem
> is that we
> have NO common AGREED-TO standard of how to "handle-current-packets-
> properly" Your statement is like the age-ole' "buy low, sell high"

We DO have a common AGREED-TO standard. It is the third-party packet standard defined in Chapter 17 of the spec and the APRS spec, as a whole. The problem with packets not being handled correctly by some

versions of IGate software stem primarily from interpreting various TNC settings or Mic-E packets, not APRS packets in general. The Mic-E problems are being addressed by the removal of Mic-E conversion (first put in to help accommodate findu.com). The TNC problems will always be there as long as different TNC's exist. The software writers have done a good job of tackling those issues when they come up.

> OK, so what do you propose to handle complete paths end-to-end?

Third-party packets.

> I thought it was a given that we cannot possible preserve all hops
> end-to-end. In fact the APRS-IS currently throws away ALL source path
> information! So how can you argue against my proposal which

APRS-IS does no such thing! APRS-IS, currently, preserves the ENTIRE source path, possibly to a fault. It is NOT a given that we cannot preserve all hops, end-to-end. We do it today using third-party packets. The only thing missing is identification of the IGate that injects a packet from RF to APRS-IS. And that would be covered by the addition of MYCALL, I*.

> The proposal only says it will be possible.. So, dont use kiss if you
> dont want to. Its an option for those that want to save the
> 16 Bytes on
> RF in every APRS-IS-to-RF packet.

But then every IGate can no longer assume that a non-third-party packet is from RF. There isn't enough APRS-IS to RF activity to justify adding this level of complexity to save 16 bytes for some packets (I still don't see where you get 16) by someone who might do this in the future.

> Its 16 bytes or so. AND all APRS software currently has to
> handle dozens
> of formats. KISS mode adds ZERO complexity, because it is

Not true. You add the complexity of no longer having a definite indicator of an Internet originated packet. Today, we do. It is a third-party packet with TCPIP in the third-party header.

This also affects all client software today that differentiates between
gated and RF direct packets. Is it really worth asking all software
authors to re-write their packet parsing code to accommodate the
possibility that someday, someone might not use third-party packets to

inject a gated packet into the VHF network? What we have today works. There is nothing wrong with it. Adding the possibility of gated packets appearing as regular packets gains nothing other than adding another level of complexity to already complex programs.

After some thought, I realize that I think we are in violent agreement.
The path "condensation" technique I propose above only takes place when
the packet must be routed back to RF. That is when my 7-hop model kicks
in. I may not have presented it well. When the path is injected into the
APRS-IS it remains in full with only ",IJGATE,I" tacked onto the end.
Thus it is available throughout APRSdom with full path intact.

It is only when processes need to shorten the path that then my 7 Hop
model kicks in to provide a standard technique. This only occurs when
the packet goes back to RF. In this sense, it is far better than the
current APRS-IS technique of eliminating the ENTIRE path.

Yes, that is exactly the problem I am trying to solve. If we put down an
END goal and a phased plan to get there, then we solve that problem.

That is exactly the point. With every author doing his best to define
what the APRS-IS is and with no written guidance to a common standard, we
have everyone working hard in different directions and only making things
worse instead of better.

> The first is being actively worked on by the IGate authors. The
> second gets worked on as they occur.

But what is their guidance? It is EASY to write code as long as one knows
for sure where he is going and what is his end objective. It is impossible
to write code that works reliably with everyone else when everyone else
is not necessarily working to the same end objective..

Im a little behind on email, but just to clarify my proposal, I dont want
to trim any path information going into the APRS-IS. That is where we
have the bandwidth and want to see everything. The path "condensation"
process I suggested is only when (or if) a path needs to be truncated when
it goes back to RF... Bob

Huh? I don't follow your logic. Here is the way it looks to me:

- 1) The current APRS-IS currently truncates ALL source path data in its use of 3rd party IS-2-RF. (I want something less restrictive)
- 2) The current 3rd party format adds 16 bytes to an already very long

header. (I want to make it possible to eliminate those bytes (if we want to))...

> You are telling the IGate programmers that they now have to parse EVERY
> packet for I, or TCPIP, or TCPXX, not just third-party packets. Bob,

Really? I don't consider the following line of code "very complex":

```
If instr(packet$,"TCPIP") or INSTR(Packet$,"I") then IGNORE.
```

That does the entire job in one line. I left out the TCPXX because as Steve pointed out, that should never appear on RF in the first place. (Although I as a programmer would definitely put it in, because there never is such a thing as "never")...

The #1 problem the proposal solves is that it gives a single common objective for APRS-IS code writers (currently there is none). Further it provides for:

- 1) Injecting IGate identification (The main shortcoming of APRS-IS 1.0)
- 2) Defines a single standard for ASCII Header representation including the preservation of the HAS-BEEN-USED bit in the AX.25 digi fields
- 3) It provides for PATH PRESERVATION end-to-end for reasonable packets
- 4) It provides for a standard PATH CONDENSATION method that preserves all points of entry both in the RF and APRS-IS domain end-to-end if size limitations are exceeded
- 5) It is fully AX.25 on-air compatible.
- 6) It moves the basis for APRS-IS loop filtering to be based on actual path data through the APRS-IS instead of basing it on a second order format definition byte which is not unique to the APRS-IS and is therefore currently ambiguous...
- 7) It allows for future KISS mode implementations for seamless RF-IS-RF and any other potential non-RF linkages.

But that does not do, #1, #2, #3, #4, #5, 6 nor #7 above. I think it is time to move on...

No, we can solve the TNC differences easily and it is part of my proposal #2 above. We need to solidify to a single, unambiguous ASCII representation of AX.25 header for transfer of packets though non-AX.25 networks (such as the APRS-IS). Most authors currently target the TAPR2 standard. But that standard has one SIGNIFICANT weakness for APRS, and that is that it only displays the HAS-BEEN-USED bit of the last digi in the path. This is unacceptable to APRS which does not require sequential digi field usage and leaves us with ambiguities. The only solution is to adopt a more thorough TAPR2 type ASCII representation that preserves the HAS-BEEN-USED bit with every DIGI field. Then nothing is lost through the APRS-IS.

> > OK, so what do you propose to handle complete paths end-to-end?
>
> Third-party packets.

And nothing in my proposal does anything to eliminate 3rd party packets. In fact, by moving LOOP filtering to TCP/IP, and "I", it strengthens 3rd party format for more general use.

That is not my understanding. Every APRS-IS packet I see back on RF throws away ALL source path information and substitutes TCPIP in its place. In fact, I think chapter 16 requires it (though I don't have my copy here handy)...

> The only thing missing is identification of the IGate that injects a
> packet from RF to APRS-IS. And that would be covered by the addition of
> MYCALL, I*.

Yep, I'm trying to put a label on that capability by calling that part of APRS-IS 1.1 in the proposal... But so far a few high profile authors have not implemented it... and so we need to continue to stress the importance of this to them...

> > The proposal only says it will be possible.. So, don't use kiss if you
> > don't want to. It's an option for those that want to save the
> > 16 Bytes on RF in every APRS-IS-to-RF packet.

>

> But then every IGate can no longer assume that a non-third-party packet
> is from RF. There isn't enough APRS-IS to RF activity to justify adding
> this level of complexity to save 16 bytes for some packets (I still
> don't see where you get 16) by someone who might do this in the future.

I can think of MANY present and future applications that can benefit greatly from not only KISS regeneration but also general use of 3rd party format. BOTH OF THESE are completely blocked because of the current APRS-IS loop filter dependency on 3rd party as the only loop filter. In my opinion, we must move away from that dependency and eliminate this roadblock to future development!

> > And all APRS software currently has to > > handle dozens
> > of formats. KISS mode adds ZERO complexity, because it is...

>

> Not true. You add the complexity of no longer having a definite
> indicator of an Internet originated packet. Today, we do. It is a
> third-party packet with TCPIP in the third-party header.

So why then the dependency on 3rd party filtering since filtering on only the "TCPIP" will do the job. By eliminating the dependency on 3rd party as the loop filter, and moving filtering to the PATH data that indicates the packet actually WENT through the APRS-IS is the logically consistent way to do things..

And it frees up both 3rd party and KISS processing for lots of present and future applications and places filtering where it is supposed to be (on

path data) not on construct...

All APRS-IS packets under my proposal will be trivial to recognize. One
line of code can do it. Here it is:

If INSTR(packet\$,"I,") or INSTR(packet\$,"I:") then THIS-IS-GATED

> What we have today works. There is nothing wrong with it.

I think it is a great system. But Steve has publically stated that its one big shortocming is the lack of source identification. Adding that REQUIRES incomming packet header processing. and once you have to add that to ALL Igates, then it s trivial to fix a few other things while we are at it. All of the 7 items that I have elaborated above are trivial to do, once you have already taken the step of parsing the incoming header. My point is why not then do them?

> Adding the possibility of gated packets appearing as regular packets
> gains nothing other than adding another level of complexity to already
> complex programs.

I just dont think most code writers will find this overly complex. And since they MUST add the additional processing already inorder to do IGate Injection identification, then the rest is trivial. So I think that unless you are saying we dont want Injection-Igate-Identification, then your arguments about added complexity are moot.

I wish to clarify what I have been saying so that there is no misunderstanding. Reading the snipped emails shows me that there may be some out-of-context interpretation being done.

1. APRS-IS is not broken. There is software in existence that does not comply with the APRS specification. There are TNC's poorly configured which confuse the APRS software. There are other issues that have nothing to do with this thread such as server interconnections and verification.
2. Third-party packets should follow the specification regarding source header format (trimming all unused digis and removing all * before appending TCPIP,MYCALL2RF*). If software doesn't do this, it needs to be corrected in that software. If the source header ends in TCPIP or TCPXX, only MYCALL2RF* need be appended.
3. I agree that injection IGate identification should exist. After looking at statement #2, I think the insertion identification should be done after performing the third-party header trim function. Then, the insertion identification should be MYCALLIN,TCPIP* This indicates "was digi'ed by MYCALLIN and is seen digi'ed by the Internet". Then, the end gating back to RF would only need to remove the * and add MYCALL2RF* to the outgoing third-party packet header.

The above statements show that a specification does exist today in the standard APRS spec for gated packets. #3 is a fully backward-compatible addition to that specification.

I believe that adding the possibility for gated packets to appear as non-third-party packets does the following:

1. Makes all IGate software that currently exists incompatible with those packets as no IGate software currently considers non-third-party

packets as gated.

2. Makes all client software that currently differentiates between RF and gated packets incompatible with those packets.
3. Introduces the possibility of path history loss due to AX.25 restrictions.
4. Adds a level of complexity currently not defined in the APRS specification.

A quick look at the APRS-IS data stream shows that we can't "force" someone to upgrade their software. We see this all of the time with older IGate software with known bugs still being used. If number 1 regarding gating as standard packets is true, then we introduce a definite loop problem as older software will not know when not to gate the packet to the Internet and the servers would have no way of knowing whether a packet was originated on the Internet or gated to the Internet. This means that the servers would have no protection against this type of loop if the packet is gated back to the Internet outside of the dupe check algorithm limits.

While maybe not the absolute most efficient format from the standpoint of length, third-party packets provide a well-defined method for gating packets to an AX.25 medium. By definition, gated packets are the exception, not the rule. The .1 to .2 second transmission savings for the packets that could be transmitted in AX.25 format may not be worth introducing the incompatibilities listed above.

For what it is worth, here is what I wanted as the ultimate APRS routing plan back in 1995 when I was trying to come up with the shortest possible packet for the Mic-E (and later the kenwoods):

SSID-ROUTING: This uses the SSID on the TOCALL to indicate N hops just like we do WIDEn-N. But since it is the SSID on the TOCALL, then there is no need for the 7 byte or any additional 7 byte digi fields. Thus

MYCALL>TOCALL-N:'LLLCS/\$

Was a complete Position/Status/Comment packet and only took 0.2 seconds. This capability is built into every Mic-E and or Kenwood, and in fact can still be done by ANY TNC. But three things went wrong preventing its wide spread usage:

1) The only DIGI-writers to implement SSID routing were DIGI_NED, UI-DIGI and Kenwood.

2) The SSID-N just like the WIDEn-N expected the FIRST digipeater to do callsign substitution, so that the path was traceable back to the RF injection point. This was destroyed by Kantronics missinterpretation of my spec, and they made all WIDEn-N digi's insert the LAST digipeater. This is the well known issue that I beat to this day, that NOID must be enabled so that Kantronics TNC's do not do this. If ID is on, then kantronics destroy the SOURCE-DIGI field.

2.5) Notice, that because of this Kantronics error, that we individually have to put the SOURCE digi into the packet ourselves as WIDE,WIDEn-N. And this causes dupes in the network and now requires 14 additional bytes

in every packet over what SSID routing could do.

3) One popular application (against my strong objections) began using the TOCALL SSID for other purposes. Thus these packets would do wild things if ever introduced on 144.39 if SSID routing were implemented.

We have several things (Finally) that can bring SSID routing back out of the closet and let it revolutionize APRS with shorter packets. Remember that SSID routing is 100% identical with WIDEn-N but it saves 7 to 14 bytes in every packet. And for a Mic-E, Tiny-Track, MIM or Kenwood posit packet which is only 23 bytes long in the first place, that is a 25% to 35% improvement!

We could actually realize SSID routing in the future because:

- A) More and more people are using UIDIGI, DIGI_NED, and other home-grown digipeater software. These run on any-old TAPR-2 TNC and there are hundreds of thousands of those around...
- B) Kantronics is probably working on a follow on release? I have no knowledge, but it has been a long time since they had a release. (Except then we would have to suffer the complaints of everyone (over the \$60 upgrade cost)...
- C) More and more people are accepting the idea that the most important digi for path tracing is the FIRST one. The place where the guy is and the place where the packet first enters the network. (NOID)
- D) The other application that uses TOCALL ssid's for other purposes remains on another frequency and so far has not been a problem.
- E) We need everything we can to improve network efficiency.

If you want to hear how short a Mic-E packet is with SSID routing, take your kenwood, change its path to "3". Not RELAY, NOT WIDE, not WIDE3-3 but simply 3. Then change the transmit mode from AUTO to PTT. Then push and release your PTT button. Short and sweet!

AND it is 100% equivalent to "DIGI1,WIDEn-N" if the network would just do it that way saving actually 14 bytes per packet.

Anyway, jsut something to chew-on...

I won't chime-in any longer on this topic, other than this last time. It's
become obvious that we're in the same position with this thread as we were a
couple of years ago with the APRS Protocol Specification discussion. Until
things are fully documented as they are, it will be difficult to offer any
assistance in getting us to where we need to be.

Until then, only those that are actually coding to the IStream really know
the ins and outs and the rest of us are often times suggesting solutions
that can't work for one reason or another.

With that in mind, my last comment (other than if a point endagers an eventual BEACONet use of the IStream) is below...

Consider a server-side rather than client-side solution, not unlike a router table. When an author generates a "registered" copy of their software they submit a proprietary hash to the client and both the callsign and hash to the server.

- o Authors are still generating the hash table...they simply send the 'registration' information to two places, rather than one.
- o Each author can use their own proprietary hash-table
- o Authors simply share their hash-table with the APRS-WG for archival
- o New authors could be evaluated prior to being given access to update the server table

The risk profile is significantly reduced.

Client-side software requires no (or minimal) modification (aside: if the hashcode for accessing the IStream changed, it would force software upgrades...maybe not a bad thing anyway).

Server-side software does. :o)

With kind regards,

Ev, W2EV

> comply with the APRS specification. There are TNC's poorly configured
> which confuse the APRS software. There are other issues that have
> nothing to do with this thread such as server interconnections and
> verification.

All of those add up to a big mess. "Broken" was a poor choice of words on my part. But EVERY code writer involved in the APRS-IS to my knowledge admits that things are a "mess!".

> 3. I agree that injection IGate identification should exist. After
> looking at statement #2, I think the insertion identification should be
> done after performing the third-party header trim function.

Impossible. Currently the header TRIM function is done at the DX end long after the packet was injected into the APRSIS. If you wait till then, then you have no clue where it came from, or if you somehow solve that problem, then you are trimming at injection, which I though we all agreed was not what we want. We want the PATH data to remain intact into the APRS-IS because of its WEALTH of information. If you trim at injection, then FINDU would never be able to show you the path of your packets.

> Then, the
> insertion identification should be MYCALLIN,TCPIP* This indicates "was
> digi'ed by MYCALLIN and is seen digi'ed by the Internet". Then, the end
> gating back to RF would only need to remove the * and add MYCALL2RF* to
> the outgoing third-party packet header.

We should never be discarding valuable "has-been-used" bits (the *). In your example above, then there is total ambiguity in the MYCALLIN field.

Was it the IGate, or was it an intended (but unused) path in the original packet?

> #3 is a fully backward-compatible addition to that specification.

But is impossible to implement (as written), removes all PATH information at injection. Continues our dependence on 3rd party as the only loop filter, prevents use of the more efficient KISS mode implementations, prevents any other use of the 3rd party format, and stagnates us to the status quo.

> I believe that adding the possibility for gated packets to appear as

> and gated packets incompatible with those packets.

That is why we are trying to define our goals for the future.

> 3. Introduces the possibility of path history loss due to AX.25
> restrictions.

Exactly the opposite. Makes it possible for PATH preservation for typical packets end-to-end through the APRS-IS

> 4. Adds a level of complexity currently not defined in the APRS
> specification.

Which is trivial to do. Big deal...

I disagree completely. If done as I proposed, the plan is fully backward

compatible, AND also it has a mechanism for detection obsolete software and disconnecting it from the network automatically if we want so that the NETWORK can protect its processes from old obsolete software. That is the whole point. The current process has no such mechanism!

The network must have a plan, and the plan must allow the network to assure compatibility or we have gained nothing and are forever stuck in the mess we have now. Sticking with what we have is not what we should be focused on when it has some particular constructs that tie our hands from doing what needs to be done.

Its called progress. I agree that the .1 second savings are not at all the driving force. Go back and look at the 7 advantages I enumerated. Only one of them is the .1 second savings.

> knowledge
> admits that things are a "mess!".

But not due to the design of APRS-IS. What we are talking about here is specifications for IGates, not an APRS-IS specification. And we are talking, in some cases, about software that does not conform to the current APRS specification.

> > 3. I agree that injection IGate identification should exist. After
> > looking at statement #2, I think the insertion
> > identification should be
> > done after performing the third-party header trim function.
>
> Impossible. Currently the header TRIM function is done at the DX end

Bob, you completely misunderstood what I was saying. I was saying that the trim function should be done at the receiving end before adding the insertion identification. It would have NO affect (other than make things simpler) for the DX end.

> We should never be discarding valuable "has-been-used" bits

We are not. The definition of the TNC-2 header says that ALL digis up to and including the one with the * have been used. If you want to have the insertion IGate put asterisks on every digi up to the one with the *, fine.

> your example above, then there is total ambiguity in the
> MYCALLIN field.

> Was it the IGate, or was it an intended (but unused) path in
> theoriginal
> packet?

No, Bob, it is not ambiguous. If you see a TCPIP* at the end of the path, then the previous callsign is the IGate. This accomplishes the EXACT same thing as your "I" without adding another variable to the equation. Again, if you want all of the via fields given an asterisk, it has no affect on the overall meaning.

> > #3 is a fully backward-compatible addition to that specification.
>
> But is impossible to implement (as written), removes all PATH
> information
> at injection. Continues our dependence on 3rd party as the only loop

It does NOT. It removes all UNUSED path information. Re-read Chapter 17 of the APRS specification.

> > 1. Makes all IGate software that currently exists incompatible with

> > and gated packets incompatible with those packets.
>
> That is why we are trying to define our goals for the future.

But why make your future incompatible with the present?

> > 3. Introduces the possibility of path history loss due to AX.25
> > restrictions.
>
> Exactly the opposite. Makes it possible for PATH preservation for
> typical packets end-to-end through the APRS-IS

Once again, Bob, this is an inaccurate statement. The transformation necessary to return the packet to AX.25 compliancy dictates that paths will not be preserved because they will be shortened, losing valuable routing information.

> I disagree completely. If done as I proposed, the plan is
> fully backward
> compatible, AND also it has a mechanism for detection
> obsolete software
> and disconnecting it from the network automatically if we

> want so that the
> NETWORK can protect its processes from old obsolete
> software. That is
> the whole point. The current process has no such mechanism!

WHOA!!! Now you want the servers to monitor the data stream for compliance to a spec they have NO way of detecting! AND, you want the APRS-IS servers to be an enforcement agent against people using out-of-date software! Again, for the reasons stated in my previous email, your plan is NOT backward compatible. If it were, why would you need this "enforcement".

> The network must have a plan, and the plan must allow the network to
> assure compatibility or we have gained nothing and are
> forever stuck in
> the mess we have now. Sticking with what we have is not what we
> should be focused on when it has some particular constructs that tie
> our hands from doing what needs to be done.

But our hands are not tied. Since you like using clichés, how about "throw the baby out with the bath water". That is what the final part of your proposal amounts to. Until now, your recommendations had nothing to do with APRS-IS but everything to do with IGate functionality. You don't rewrite a specification because some software written doesn't implement it properly. You get the implementers to adhere to the spec. If a feature can be safely added to the spec, such as appending the MYCALL,TCPIP* or making all used VIA calls have asterisks, great. But I also believe you "don't fix what ain't broke". And that is what you are proposing above.

The APRS-IS is reasonably well defined:

1. No third-party packets passed as third-party packets on APRS-IS.
2. Distribute ALL packets with properly formed headers and a data byte if from a verified source.
3. Use TNC-2 or AEA header format as applicable.
4. Maintain a 9 character maximum for all FROM, TO, and VIA calls.

What could be more flexible?

IGates should currently be following the APRS specification:

1. Gate to APRS-IS the payloads of all third-party packets whose third-party headers do not contain TCPIP or TCPXX.
2. Gate to APRS-IS all other packets with a data byte (dupe checking here is encouraged).
3. Use the defined third-party packet for gating packets from APRS-IS to RF.

The addition to identify IGates that inject a packet into APRS-IS is:

4. Perform the header trim specified for third-party headers, then append MYCALL,TCPIP*.

This remains fully compatible with today's software yet provides the capability for IGate authors to enhance their products to support full path history.

> Its called progress. I agree that the .1 second savings are

Progress? Or one man's desire to see something done without regards to the consequences (which is the most common use of the word "progress")? I am sorry, Bob. But that is what your responses to my previous post reflect. Take a step back, take a deep breath, and re-read my previous post without the preconception that you will take issue with it. I laid forth some very solid reasons why the addition of using standard AX.25 packet formats could (and would) be problematic.

I'd rather not attempt to store the complete path history in every packet.

IP packets on the internet do not contain a history of all the switches they passed through. If they did they would grow too large. When a packet arrives you know the originator and the last router (the one you are connected to) and that's all. The internet seems to work just fine. IP packets do have a "Time To Live" integer which gets decremented after each hop. When it gets to zero it's discarded. This prevents infinite loops.

Instead of putting in an ID for every Igate a packet goes through why not just do this:

If packet does NOT have a Time To Live path element:

1. Keep the original USED path, discarding unused elements.
2. append the injecting Igates call sign
3. append the Time To Live counter as the LAST path element

If it DOES have TTL:

1. If TTL is zero discard packet ELSE decrement TTL and process.

Note the PATH of an Igated packet can be longer than an original packet by two elements.

Time to live path element:

First char: I

2nd char: R (came from RF)
I (came from validated Internet user)
X (came from a non-validated user)
S (Came from Igate Internal status)
Other codes possible...

3rd char: digit 0 to 9 is initial time to live in hops

4th char: -

5th char: Current Time To Live (TTL) value, decremented by each Igate

Examples: II4-4 IX3-3 IR5-5

Original pkt from TNC:

WA4DSY>N4ZZ*,WIDE2-1,WIDE:Hello

after it hits the first Igate WA4GT

WA4DSY>N4ZZ*,WIDE2-1,WA4GT,IR4-4:Hello

Second Igate output

WA4DSY>N4ZZ*,WIDE2-1,WA4GT,IR4-3:Hello

Third

WA4DSY>N4ZZ*,WIDE2-1,WA4GT,IR4-2:Hello

Forth

WA4DSY>N4ZZ*,WIDE2-1,WA4GT,IR4-1:Hello

fifth

WA4DSY>N4ZZ*,WIDE2-1,WA4GT,IR4-0:Hello

sixth

Discarded due to Time to Live being zero.

With TTL we can do things like set TTL to zero for Igate status messages and they will only be seen by the users on that particular Igate.

Number of Igate hops a packet took can be determined.

Infinite Loops impossible assuming the loop includes at least one Igate that knows about the TTL path element.

Anyways, I thought I'd share my thinking here for whatever it's worth.

I still cannot follow what you are trying to say... there are four or more "receiving ends". I don't think we should TRIM at the injection point, and if you don't add the ID till after the trim at the distant IS-2-RF point, then that is impossible because INJECTION ID must be done

at the first...

Nope, not under my proposal. The original path data can be preserved end to end in most cases (That is up to an original 3 hop path) Beyond that, it preserves the SOURCE digi, and the number of hops, and then all after...

It is a future option if obsolete software is causing problems. But the fact that it is backwards compatible and old software that does not cause problems will continue to work...

I think one of the main things we want to preserve is the ability to watch the APRS-IS stream and see all raw packets in their entirety. Thus nothing gets dropped at the injection end. Only the Injecting IGate adds its MYGATE*, to indicate it is the entry pint into the APRS-IS and then it adds the "I" to indicate that is where it goes next.

> > IP packets on the internet do not contain a history

But this is ham radio and the Internet is only one piece of the pie.
I don't care at all about what happens within the APRS-IS other than we
know where it went in, and where it comes out.

> Instead of putting in an ID for every Igate

I don't want to lose the ability to observe ALL aprs packets worldwide in
their raw form...

> after it hits the first Igate WA4GT
> WA4DSY>N4ZZ*,WIDE2-1,WA4GT,IR4-4:Hello

I agree that I don't think any of us care about the inter-APRS-IS hops..
so is this level of added stuff needed?

> Anyways, I thought I'd share my thinking here
> for whatever it's worth.

I am not at all discarding your ideas, that may be great, and entirely
within the internals of the APRS-IS. Such input is very welcome. So
far, all my rantings are only concerned with how it gets in from RF and
how it goes back to RF. So I will keep a low profile with how you
guys decide to do the internal stuff.

So the only focus of my comments above are that I want to not throw
anything away going it so that we can always monitor the global APRS
system by just watching the APRS-IS..

bob

> > a packet goes through

Having an Igate source packet on the path is a very good thing. It was
a kick watching the PCSAT page for packets Igated from my system.

Implementing it is trivial.

1. Well behaved TCP applications append "callsign,I" before uploading a packet.
2. Legacy applications and Igates wouldn't append the callsign. The server
they're
connecting to knows who they are - they gave a login callsign. So the server can
add the "Callsign,I*" if the application didn't put it on.

Bingo - all Igated packets have a source ID. It might not be 100% accurate in
the
case of multiple old Igates without the source callsign addition code - but I bet
it
wouldn't take long before most of them were updated.

73,

Bill - WA7NWP

It is obvious to me now that you do not have any comprehension of what I have said. This may be due to your lack of knowledge on how APRS-IS works or networks as a whole operate, I don't know. Whether by accident or by purpose, the APRS specification actually does a good job of defining how interaction with non-AX.25 networks should occur.

> I still cannot follow what you are trying to say... there are four or
> more "receiving ends". I don't think we should TRIM at the injection

So what? Each RF->APRS-IS gating IGate trims the packet to the last used digi it sees and then appends its MYCALL,TCPIP*. The packet which reaches the core first will be the one that is passed back to the rest of the world and the others will be duped out. You have a complete path history visible on APRS-IS and you have identified the gating IGate. You have also made the transition back to RF extremely easy by allowing the APRS-IS->RF IGate to simply append its own callsign to the third-party packet header. For packets not ending in TCPIP or TCPXX, the APRS-IS->RF IGate would still need to trim the packet to the last used digi and then append TCPIP,MYCALL*, per the APRS specification on third-party headers.

> It isn't. All of my proposal is backwards compatible.

Per my previous posts, I showed that, in fact, they are not backwards compatible.

> Nope, not under my proposal. the original path data can be
> preserved end
> to end in most cases (That is up to an original 3 hop path)
> Beyond that,
> it preserves the SOURCE digi, and the number of hops, and then all
> after...

Bob, you just contradicted yourself. "in most cases", "preserves the source digi and the number of hops" These statements say that any other digis used in the path are lost in any cases where this path reduction is done.

> It is a future option if obsolete software is causing
> problems. But the
> fact that it is backwards compatible and old software that
> does not cause
> problems will continue to work...

Again, the injection to RF of APRS-IS packets as standard APRS packets is not backwards compatible, as shown. Look for other methods to encourage people to upgrade software. Forcing incompatibilities is not the way.

> Then you still are not seeing the concept or missing the point.

That may be, Bob. But apparently you have also missed every point I have made. Hopefully the IGate authors and APRS-IS server authors can

get together to create a working group to create a specification for IGates and a specification for APRS-IS. Those specifications must be based on the APRS specification to be of any use. Hopefully they will have the foresightedness and broad mindedness to carefully review the ramifications of specification alterations before incorporating them. Those specifications need to be created by those that have a complete understanding of APRS-IS and its interactions internally and to the RF world.

```

Yes, I think that's a good idea. So my revised suggestion is:

If incoming packet has no I or I* on the end of the path,
remove unused path elements and then append users call sign
and the Time-to-Live path element. eg: II4-4

If incoming packet has I or I* on the end of path
change the I or I* to the proposed Time-To-Live path element
and set TTL to default.

If incoming packet has Time-to-Live then check for zero
and if not zero decrement it.

Proposed TTL codes: IIIn-n = Internet source IRn-n = RF Source

Examples assuming logged on user is W4XYZ and Igate is W4ABC :

User application did nothing to path.

INPUT: WA4DSY>APRS,WIDE*:Hello

Output: WA4DSY>APRS,WIDE*,W4XYZ,II4-4:Hello

User application appended his call and "I" to the path

Input: WA4DSY>APRS,WIDE*,W4XYZ,I:Hello

Output WA4DSY>APRS,WIDE*,W4XYZ,II4-3:Hello

Note we pre-decrement the TTL above to account
for the previous hop.

User applicaton supports TTL

Input: WA4DSY>APRS,WIDE*,W4XYZ,II4-4:Hello

Output:WA4DSY>APRS,WIDE*,W4XYZ,II4-3:Hello

If packet had come from the TNC on W4ABC Igate:

INPUT: WA4DSY>APRS,WIDE*:Hello

Output: WA4DSY>APRS,WIDE*,W4ABC,IR4-4:Hello

For this to work correctly all existing Inet to Inet APRS

servers (hubs) must not append anything to the path or they will push the TTL field back from the end. Anyone do this?

>
> Bingo - all Igated packets have a source ID. It might not be 100%

I have to things to be added to the draft spec:

1) The new draft spec for APRS IS specify that "All packets are injected in their RAW form". It should be added to this that the DATA portion should fully support 8-bit characters.

2) No conversion of any packets should be allowed which is passed back to the APRS IS. I'm in particular thinking of Mic-E conversion that are feed back with timestamps of the converting system. The client should be fully responsible for any necessary conversion.

I agree that it is clear we are not communicating well... And that you seem to have some misunderstandings of how the APRS-IS works..

> So what? Each RF->APRS-IS gating IGate trims the packet to the last
> used digi it sees and then appends its MYCALL,TCPIP*.

Sorry, that is just not right. TELNET to any of the HUBS or to the central SERVERS and you will not see TCPIP added to ANY RF packets other than IS<->IS only ones that are originated by the IGATES themselves. All RAW packets from RF are distributed as received... This is the way it is. I think this is what you are missing...

Now, in APRS-IS 1.1, we are improving that by asking all IGATES to append ",INGATE*,I" onto the end of all such inbound packets so that we can see where they are coming from. Still though, there is no truncation nor dropping of ANY path data. We want to continue to use the APRS-IS to view the world of APRS in its raw form. We never want to lose path data on packets INJECTED into the APRS-IS.

> Per my previous posts, I showed that, in fact, they are not backwards
> compatible.

No you have not. You threw out a lot of arguments, but they either misunderstood my proposal, or were based on incorrect assumptions about how the current APRS-IS system works. Unless I missed something, I don't recall any valid point that you have made that causes my proposal to not be backwards compatible. Remember, my proposal is a phased approach. I agree completely that we cannot do them out of sequence nor can you do version 1.2 without having 1.1 in place first. But if we do it right, then it is backwards compatible. What I mean by that is that it WON'T BREAK ANYTHING. I am not claiming that it will continue to support software written 5 years ago that has not kept up with the current APRS-IS objectives..

> > to end in most cases (That is up to an original 3 hop path)

> is done.

No, there is no contradiction. I am talking apples and you are arguing oranges... You still appear to not understand that both the current APRS-IS and what I propose both DO preserve ALL path data INBOUND. I hope

we all agree that we always want the APRS-IS to preserve all original packets with NO loss of path data to all APRS-IS online viewers. Do we agree here?

Good.

Then the only issue of path truncation ONLY occurs when a packet is prepared for OUTGATE transmission on RF. Currently the OUTGATE then makes sure that its call,TCPIP are in the path and THAT is when it drops all unused path data. The way I read what you keep saying is that you think this process occurs when the packet enters the APRS-IS. This is just not correct. It occurs only when the packet is prepared for the OUTGATE.

Dale,

I think I can maybe agree with most of your post (below) except that I still want to preserve ALL path data on the INBOUND APRS-IS process just like we have now. We want to be able to continue to use the APRS-IS as a means to view ALL raw packets worldwide. Bandwidth within the APRS-IS is not an issue.

There is no need to throw out even unused path data on the 99.99% of all APRS-IS packets when only 00.01% of those packets ever go back to RF and that is the only time that the length of the header is of any concern..

Lets dont drop ANYTHING unless it is one of the 00.01% of APRS-IS packets that has to go back to RF. Then lets first try just dropping unused path fields (like we do now). If that is still too big, then lets use my intelligent truncation model which always preserves all critical entry point and hop counts...

Bob

It would be nice to have some sort "TTL Exceeded message" sent back to the source (if possible) when the TTL hits zero.

This would allow one to use a "traceroute" like command to determine the path a packet might take.

(Traceroute identifies a path taken by an IP packet by sending a packet to the destination, first with a TTL of 1 , then with TTL of 2, then a TTL of 3, etc. It then can figure out the path by looking at the source of returning "TTL exceeded" packets").

Ahhh, something to keep in mind for APRS Spec 2.0 I guess.

What this part of the spec currently says is not what it really means.

1. It does not really mean "raw form".

2. If I'm reading the correct document (I'm getting slightly confused
about that!) it also doesn't really mean "the packets may be in any
recognizable TNC header format".

In fact what is acceptable is only two of the three major decoded frame
header formats that are in use in TNCs, and even then only in their most
simplistic form - all frame type information removed.

Due to the adversarial nature that this thread has taken, I have decided not to pursue it any further. Suffice it to say that I have presented substantiated reasons why Bob's proposals, as they stand today, introduce incompatibilities with the APRS specification and with current IGate software.

For those of you who are IGate authors, I will be happy to elaborate off-SIG if you wish. I don't feel this thread is going anywhere with the friction apparent in the posts.

I hope that the IGate authors and APRS-IS server authors get together and address creating an IGate specification and APRS-IS specification. I don't believe anything is to be gained by arbitrarily creating such documents without their guidance. As an APRS-IS server author, I would be willing to compile such documents in conjunction with a working group made up of those individuals, similar to what Ian did with the APRS specification.

Quick question. Is it safe to append two additional path elements
to an Internet aprs packet that has 8 digis already
in the path? Total length of path would be 11 (including dest addr).
Will any existing client or server programs will blow up?

I need to know what to do when I append the injecting CALL
and Time-To-Live path items to the original path. Bob does not
want anything removed from the original path.

Let me clarify about SSID-N routing:

- 1) In my opinion, the directional digipeating is a dead concept
- 2) This frees up 2 of the four SSID bits for other use.

Here is how I think SSID-Routing should be implemented. Remember the SSID here is on the AX.25 TOCALL and that no digi field is needed or used. That is where the savings comes in.

- a) SSID-N is identical to WIDEn-N except it saves 7 bytes
- b) All digis digipeat the packet after decrementing the TOCALL SSID.
- c) The 3rd and 4th bits are PRIORITY bits. Thus

- 00xx are just like WIDEn-N hops 0 through 3 but are routine packets
- 01xx are just like WIDEn-N hops 0 through 3 but are priority packets
- 10xx are just like Widen-N hops 0 through 3 but are urgent packets
- 11xx are reserved for future use.

d) IN ADDITION, the first digi to hear a SSID-N packet checks the digi fields. If empty, it inserts its MYDIGI call to mark the source of entry of the packet into the APRS RF system.

e) Normal DUP filtering is also applied.

You ask what good are the priority bits? It depends. But if our network is ever smart enough to make decisions under stress, the routine packets with large hop counts might be the first ones to be dropped.

You ask what about hops above 4? Simple, use WIDE4-4 or whatever. This SSID-N idea is only for high efficiency locally where the majority of packets are 3 hops or less.. All of the other APRS digipeater options remain.

I think going from RF=>IS into APRS-IS it should not be a problem. We want to see all packets in their raw form (like we have now) and we want INgate identification. Thus size should not be a limitation.

But let me clarify some things I have said to make sure I am not confusing others. My perspective has been describing the APRS-IS from the perspective of what goes from RF=>IS into an INgate and what can happen at the IS=>RF at an OUTgate. I think Dale and Steve are looking also at what goes on inbetween (which has not been my focus)...

One thing I would change about Dale's idea is that it should not be a time-to-live, but a time-to-die. His time-to-live starts with N and decrements. This assumes apriori knowledge about what is a reasonable N to start with and is not backwards compatible with existing "INgate*,I".

Whereas by using "INgate*,I" and then Incrementing I on every "internal-to-the-IS layer thorough the servers, and hubs, and regional distribution points, then each such point is better aware of its distance down the tree and so is better in a position to KILL a packet with a TIME-TO-DIE counter (I#) that has gotten too BIG.

In otherwords, INgates still inject with "INgate*,I" but then the IS processes Increment I each time an internal distribution occurs. It then becomes "INgate*,I1" then INgate*,I2", "INGATE*,I3" and so on.

Bob, since the primary reason for time-to-live (ttl) is to stop infinite loops, †your incrementing I# idea will work. But, I wanted an additional piece of info in there - the source of the packet: TNC, Internet client, another aprs Server or Hub, or internal to the Internet server.

So far I have defined the following for Time-to-Live:

Assuming ttl is 5, MyCall is WA4DSY, Logged on user is WA4ABC

and the path does NOT already have an I or IxN-N (old software).

WA4ABC,IC5-5 † from validated internet Client
WA4DSY,IR5-5 † from local TNC (RF)
WA4DSY,IS5-5 † from data I get from connecting to a Hub or Server
WA4DSY,IU5-5 † from UDP port
WA4DSY,II1-1 † from Internal source (status msg etc)

The only questionable one is the Hub source. †Perhaps it should have the first N characters of its domain name instead of MyCall (suggested by Steve).

If a packet comes in from anywhere except the TNC and already has a MYCALL,I on the end of the path I just change the I to Ix5-5 where x indicates the source.

If the packet has an TTL path element on the end I check for ZERO and decrement it if it's not. †Discard if it was zero.

The path will be either zero or 2 elements longer than the original.

So, there it is and I've coded almost all of it and it basically works. I could change to your I# idea but I'd lose the source info. † Is it of value or not?
Also, why is I# more compatible than IxN-N ?

Oh, one more thought. By using time-to-live count DOWN the originator controls how far his packets can go. Most of the time he sets the value high enough to pass through more than the maximum hubs and/or servers. However, if my server has some status messages intended for local users that the whole world does not want such as (but not limited to) the ">JAVA" status messages, he can set those with a TTL of 1 so they don't go beyond the logged on users.

If I were to put this up on IS at wa4dsy.net do you all think anything would blow up????

Should be equivalent. The second one uses SSID-N routing.

Forget directive routing. It was a good idea a long time ago (back in 1994 when I first came up with it, but it is of no value now)...

Seems like a good idea to me...

but will be a poitin of contention getting everyone to agree what "best" means under any given situation..>

If attempts to unilaterally create specifications with preset agendas and add "features" to the APRS-IS data stream continue, then I hope the people that do this realize that instead of helping APRS-IS, they are most likely going to create a bigger mess. As it stands today, APRS-IS is, for the most part, working and working well. I would think that before rushing headlong into "fixes" and "enhancements", we, the amateur radio community, would like to first have a detailed specification of what exists today and what is supposed to exist (based on the APRS specification) today. IMO, this APRS-IS specification should originate from the authors of APRS servers and authors of IGates as they should have the best knowledge of how their software is designed and how the current APRS-IS is architected. I would hope that they also have a firm grasp of the APRS specification.

Once this is done, the working group of authors described above should look at enhancements on an individual basis, reviewing compatibilities with the APRS-IS specification, compatibilities with the APRS specification, restrictions, benefits, etc. Also, the working group could take on the task of defining a next-generation APRS-IS if deemed necessary. But if the task of defining a next-generation APRS-IS is done before a valid current APRS-IS specification is finished, most of the knowledge gained from the current APRS-IS will be lost thus making a next-generation APRS-IS very iffy.

I repeat my offer to assemble a current APRS-IS specification in a similar manner to what Ian did with the APRS specification. To do this, however, will require an organized effort on the parts of all of the APRS server authors and IGate authors.

We have a working system today. I would like it to continue to improve in reliability and features, but this takes a coordinated effort. I

don't believe it can be done by people unilaterally implementing their own agendas.

Pete,

I think it is a good idea to have the current authors of server/igate to document the existing APRS-IS specification. However when going to next step of defining the future to have a working group of only software developer is too narrow. It is important to have a broader group with representants for the different groups:

- APRS IS Server developers
- Igate developers
- Digipeater sysop
- Users
- International representatives

This is also true for the the normal APRS Spec working group. One important thing is that the working group should represent the users/developers etc and not everybody can be a members.

All,

I suggest we accept Pete's offer to work with the developers to document the current APRS IS spec and agree on a deadline when this should be finished (Pete should let us know how long time he need). In parallel we should agree who should be represented in the APRS IS working group for the new specification and give that team the objectives. These include what the current problems are etc.

The following question will be if we should have 1 or 2 working groups, one for APRS IS spec and one for APRS Spec. But the members in the groups should be selected using same crateria as above.

73 de sm5nrk/Roger

This is an important point. The working group needs to be kept to a reasonable size.

> when this should be finished (Pete should let us know how

> long time he need). In parallel we should agree who should be

This will depend on the creation and participation of the initial APRS-IS working group. I can create a rough draft rather quickly, but I would consider it of no value unless the other developers review, modify, and otherwise revise it to more accurately reflect a true specification.

> The following question will be if we should have 1 or 2

IMO, there should be two groups. The APRS WG consists primarily of people that are focused on the tactical aspects of APRS that most affects client software and hardware. The APRS-IS WG should consist of people who are more focused on the internetworking and networking aspects that the Internet medium facilitates which most affects IGates and APRS servers. Both working groups should, of course, work closely together to ensure there is no divergence in either specification. Basically, the difference between the two groups would be in how the various expertise is weighted.

Didn't think about that, I now fully agree that it should be 2 groups.

Roger

Aprsd server wa4dsy.net is now running a experimental version of aprsd215b1. The biggest change is the addition of a Time_To_Live counter at the end of the AX25 path and preceeding it is an identifier that shows where the packet came from. This is explained in more detail below.

This version honors RFONLY and NOGATE by dropping them.

EH? and cmd: packets are rejected.

Another change removes the server status messages from ports 1313, 1314 and the outgoing Hub connections. When users first connect and logon they alone will see the usual status messages. The messages will not be broadcast to other 1313 and 1314 users. Other ports are unchanged.

There are a boatload of other little bug fixes but these are the biggest and most visible. I don't consider this stable enough to release as a beta yet. I invite you to logon and observe the data stream. Let me know if you notice anything screwed up or have a suggestion.

Dale
WA4DSY

Packet Time-To-Live and source path insertions

To aid in determining where packets were inserted into the APRS Internet stream aprsd 2.1.5 appends an identifier path element at the end of the existing path if one is not already there. The identifier string contents depend on the source of the packet as follows:

Source	Identifier
Validated user	Users Login Call sign
APRS Hub	First 9 characters of it's domain name up to the 1st "."
TNC	The MYCALL string of the aprsd server

Internal MYCALL

After the identifier string is appended aprsd appends a Time-To-Live counter in the format:

I code digit - digit

The first character is always "I". The second character is a code that indicates how to interpret the preceeding identifier path element. The possible codes are C, R, S, U, I. Next is a digit indicating the initial value of Time-To-Live (TTL).

Next is a "-". The last digit is the TTL counter. It is decremented each time it passes through an APRS Internet server that supports TTL.

Code	Source
C	Validated Client (User)
R	RF packet from local TNC
S	Server or Hub
U	UDP port on aprsd server
I	Internal status message from aprsd server

Here are some examples.

Assuming ttl is 5, MyCall is WA4DSY, Logged on user is WA4ABC, we are connected to and receiving data from first.aprs.net and the path does NOT already have an I or IxN-N (old software).

WA4ABC,IC5-5 † from validated internet Client
WA4DSY,IR5-5 † from local TNC (RF)
first,IS5-5 † from data I get from connecting to Hub first.aprs.net
WA4DSY,IU5-5 † from UDP port
WA4DSY,II1-1 † from Internal source (status msg etc)

If the packet has an TTL path element on the end aprsd 2.1.5 checks for ZERO (eg: IS5-0) and decrements it if it's not. †If the TTL value was zero upon arrival the packet is discarded.

If a packet comes in from anywhere except the TNC and already has a MYCALL,I on the end of the path aprsd 2.1.5 changes the I to Ix5-5 where x indicates the source.

The path will be either zero or 2 elements longer than the original.

The default initial Time-To-Live value is 5 but can
be changed by adding "TimeToLive N" to the aprsd.conf file.

Authors,

It has come to my attention that the equivalence of objects and stations can be misinterpreted in the spec as written. APRS was designed with no distinction between "stations" and "objects". The "object" format is nothing more than an additional way of reporting the position of something with a given "label". It is only the exact "label" of the thing that is unique..

If a TNC is reporting the position, then usually the MYCALL of the TNC is given the callsign which will be used as the "label" for example ABCXYZ. If however ABCXYZ is not the call of the TNC, yet that station wants to report the position of ABCXYZ, then the OBJECT format was designed for this purpose which can allow any "named" thing to be reported without having to change the MYCALL. But on receipt, the thing named "ABCXYZ" is equivalent no matter what format reported it. The only slight difference is that for accountability purposes, we need to keep track of who is responsible for, and uploaded, the object.

Now the significance of the equivalence of all reports of "ABCXYZ" arises because the basis of APRS is as a tactical real-time display system, and is supposed to let the operators maintain the "global" tactical display

properly, (Global here being the view that everyone has of the event)... So the importance of the equivalence of all reports of "ABCXYZ" no matter what format is used can be illustrated by the following two examples:

> Example 1, When the lead tracker running the callsign of LEAD
> dies, then it will remain stuck on everyone's map. But a new object
> labeled LEAD can then be manually moved about the course to keep
> everyone's maps updated. The new object named LEAD should completely
> replace the previous LEAD. They are identical. You should not
> maintain objects and stations separately with the same name.
> In this case one LEAD would remain stuck where the LEAD TNC died,
> and the other would move, but viewers of the map will see two
> identical objects, one in the right place and one in the wrong place.
> This is not good.

> Example 2, A kenwood tracker running as WKNXYZ signals an
> emergency. In all the confusion and bedlam at his scene, he turns
> off the radio and forgets to cancel the emergency, and then is
> driven to the hospital. WKNXYZ is still showing at the bottom of
> the ravine with an EMERGENCY on every map for 200 miles; yet he is
> safely now in a hospital 30 miles away. The equivalence of
> stations and objects was designed just for that kind of situation.
> Anyone with fresh knowledge on the situation can then kill that old
> "station" from everyone's map by just sending out a KILL-OBJECT packet
> for WKNXYZ...

In summary, APRS operators who manually move things around an event map need to be able to move anything that is in the wrong place, not just "objects"... and have everyone's map match the intended display of the event. The elements of this design objective were:

1) Things transmitted in the "object" format should always be associated with the callsign of the SENDING station for accountability and system integrity.

2) Otherwise, Objects are no different from any other APRS position report. That means:

- * An incoming OBJECT replaces any occurrence of the same-name
- * An incoming POSITION replaces any occurrence of the same-name
- * A KILL OBJECT format kills any occurrence of the same-name
- * Name comparison is case sensitive. "WB4APR" does not equal "wb4apr"

I just thought I would clarify this point, because someone has pointed out that this detail of APRS design does not explicitly come across in the spec as written

I've also used APU3xx for an unproto terminal with some APRS capabilities.

The copy from yesterday still did not have some of the feedback I had received. Here is the LATEST copy that I hope includes everyone's requests: It adds:

- APCY for the Cybiko
- APJA for JavAPRS
- APJE for JeAPRS
- APU3 for UView terminal program

And it adds Xastir to the list under APX...

Here is the current list of APRS TOcalls and Version nomenclature that I have updated.

- APA A-Filter, Alinco, etc
 - APAFxx AFilter.
 - APAGxx AGATE
 - APAXxx AFilterX.
 - APAHxx AHub

APB avail

During my efforts to flush out bugs in aprsd
I've found a problem in it's handing of 3rd party

packets. I can't fix it until I know exactly how they should be handled. This is only about the current state of affairs and not possible future means of handling these.

Issue #1:

To prevent RF=>Inet=>RF loops 3rd party packets must be treated differently. They can be stopped from entering the Internet from RF or they can be stopped from going to RF from the Internet or both. Current practice varies:

Mac/WinAPRS passes 3rd party pkts to the Internet from RF.

Aprsd kills 3rd party pkts from RF but allows them from Internet sources. It also will re-format a 3rd party pkt AGAIN if it thinks that packet should go to RF. (most likely a bad thing)

Others???

Issue #2 involves the "TCPIP" in the 3rd party header. Should it have and * or not. Current practice varies.

```
WB5BBW>APX112,WD5IYT-2,K5TXU-1*,WIDE/1:}
TR8FPH>TR8SL,TCPIP,WB5BBW*::TR8CA      :ack25
```

```
W8ID>APD214,KB8YVY,K1DE-5*:{W8ID-4>APW251,TCPIP*,W8ID*:=4106.46N/
08312.00WoPHG6360/WinAPRS 2.5.1
```

```
N8N0E>APM361,RELAY*,WIDE2-2:{K4PJY>APRS,TCPIP,N8N0E*:>Messaging is OFF.
phil@K4PJY.net
```

As always, my opinion is that it should be marked with a "*" once that field has been "used" to remain consistent with the has-been-used bit inherent in the AX.25 header format.

The current internet server system has a problem when a user has both RF and Inet connectivity (I believe WinAPRS has the problem I'm about to describe).

Basically, user issues a query, such as "?APRS?" or "?IGATE?". This query goes out via BOTH the inet stream and RF.

A nearby IGATE will see that that station is in it's "heard" list and send the responses from the INTERNET ?IGATE? query back to RF... Obviously, this can be a very bad thing, as there are hundreds of responses now going out over the local RF net! Other bad things can happen when the IGATE itself gates someone's query to the internet (IMHO, this should not be allowed by IGates).

I've modified my copy of APRSD to drop all queries, no matter what the origin. But I can't stop the responses to the queries, since the formats vary so much. So the dual-homed problem still exists. I've seen cases where these dual-homed systems caused 15 minutes of solid traffic due to the hundreds and thousands of responses, and the digipeating of those responses once gated to RF. I've banned a couple of users at my IGates

for short periods of time due to their usage of queries.

My proposal:

1) IGate developers ensure that their software does NOT send queries from RF to the Internet - EVER.

2) End-user software developers require separate SSIDs on each "interface" on a multi-homed system, be that a RF, Inet, LAN, or whatever interface. Packets originating from a host will use the address of the interface which sent the packet. Thus, if someone sent a query out to the internet, the sending callsign won't be in the heard list of the local IGATEs, thus the responses won't get gated to RF - clogging the system.

--

The problem you describe is unique to aprsD. Dale has corrected it in the latest version of aprsD. Basically, queries being passed from RF to APRS-IS should not be a problem as all defined generic queries are supposed to be responded to with non-message packets which will not be gated back to RF. However, current versions of aprsD (except for Dale's beta version) respond to ?IGATE? with a message. This causes the problem of a mass of messages being gated back to RF.

Instead of blocking all queries (I hope you are not blocking directed queries), aprsD users should upgrade to Dale's latest version to eliminate message responses to generic queries.

If that means what I think it means, then each interface effectively becomes a separate station, which seems to me to be a big hammer to crack a small nut.

Won't this fix the problem -

1. IGATEs never respond to queries from the internet.
2. IGATEs never gate queries from the internet to RF, which in any case will only ever happen if all traffic from a callsign is being "forced" through by some selection mechanism.

I should, of course, have said "general queries".

What is gained by not blocking undirected queries, if the responses won't be heard regardless?

Choice 1: Block the responses to undirected queries

Pro: Lets the query get to the Inet even though most responses won't be heard. (seems pointless to me)

Con: There are going to be lots of old APRSD stations around for a while... I'm also not positive only APRSD does this particular behaviour. So, basically, today you would still clog your RF stream if you didn't block the undirected queries. But this is a problem different then the one I was trying to address.

Choice 2: Block the undirected query requests

Pro: Let's the local system operators protect their own RF LAN without relying on other people being "on the ball".

Con: The query obviously never gets to the Inet...

When released aprsd215 will not pass ?IGATE? queries
from RF to Internet. It will respond to a ?IGATE?
query from RF with a single non-directed response
back to RF. So, 1 query generates 1 response.

Directed queries are ignored.
Non-directed queries from the Internet generate
a non-directed response back to the Internet.

As you noted, there will be a lot of old aprsD stations around for a while. What you didn't note is that there will be a factor of at least 10 times as many "old" IGate stations around for even longer. Hence, your solution is even less likely to be fully implemented. I don't have any problem with IGates not gating general queries from RF to the Internet (they shouldn't be gated from the Internet to RF as they are not messages). But, it should not be assumed that this will automatically fix things due to older software continuing to be in use.

Dale,

What will the non-directed response look like?

Assume we are a hub/server and receive a 3rd party packet.

>From RF:

Should we:

- (A) kill it.(aprsd style)
- (B) pass it on to the internet unmodified (Mac/WinAprs, Xastir)
- (C) Kill it only if it has been igated to RF from Internet (TCPIP in hdr), else do (B)
- (D) If it has not igated (no TCPIP) then convert from 3rd party to normal and send to Internet , else do (B) or kill.

(E) Other

>From Internet:

- (A) Kill it.
- (B) pass it on unmodified (current practice)
- (C) Other

Our Inet to RF filter says it should go to RF
should we:

- (A) kill it ?
- (B) pass it on as-is (eg: strip path and send data to TNC)
- (C) Kill it only if it's been igated to RF before (has TCPIP in header)
- (D) wrap it in another 3rd party header † (aprsd does this now)
- (E) Other

Note that current practice has a literal loop hole. 3rd party pkts can re-enter the Internet stream via igates such as WinAPRS and be reinjected into the RF domain via aprsd.

I think D best matches what has been discussed here. Note that it should not be gated to the Internet if it came from an IGate (TCPIP in the third-party header).

> From Internet:

> (A) Kill it.

No third-party packets should exist on APRS-IS. They should have been modified per D above prior to gating to APRS-IS.

> Our Inet to RF filter says it should go to RF

Interesting question. However, per the above paragraph, if it is a 3rd party packet, it should be killed. If it is a standard packet, it should be gated with a 3rd party header if it was not already heard by the IGate on RF. This will prevent it from being gated back to the Internet since it would have TCPIP in the 3rd party header.

> Note that current practice has a literal loop hole. 3rd party

> pkts can re-enter

> the Internet stream via igates such as WinAPRS and be reinjected into

> the RF domain via aprsd.

This is why we are filtering out all 3rd party packets on APRS-IS. If the packet modification shown in D above is done, then this filtering can remain in place but non-IGate originated 3rd party packets will still be properly represented on APRS-IS.

I have an additional "possible" use of 3rd party packets.

I was using Digi_ned to "gate" HF 10.151 packets to the local two meter network. They were being broadcast on two meters with a slightly modified path showing they'd come through my system.

What made it interesting was that I wasn't really planning to be a 10.151 transmitter.

So I was sending positions of stations around the country out on two meters, Igates would see them and assume there were "local". So when somebody sent a message to one of these HF stations - all the local Igates would gate the message from Internet to our local RF system.

I think the solution, given the current discussions, is to modify digi_ned so it can broadcast with 3rd party format. Then the HF stations can show up on the local RF and will be gated to the Internet (no TCPIP in the path) yet the Igates won't consider them as

locals.

Dale,

The APRS Spec indicates that the response to an ?IGATE? query should contain the following example response <IGATE,MSG_CNT=43,LOC_CNT=14

Presently, an ?IGATE? query can result in an enormous amount of data being sent to the IS. Some of the proposed improvements to the IS would reduce the number of ?IGATE? requests but we should consider limiting the responses to the format provided in the APRS Spec since there are quite a few users of the APRS IS who are charged by the volume of data received and sent.

aprsd15 ?IGATE? response has a total of 168 bytes in your example. Is it really necessary to append other information to the response?

No. However, it conveys additional information about igates/Servers within range of the RF station. It was my understanding that additional TOKEN=VALUE pairs could be defined.

Of what use is MSG_CNT and LOC_CNT?

What sort of information would be useful?

> TOKEN=VALUE pairs could be defined.

You are correct, Dale. The spec does not limit you to MSG_CNT and LOC_CNT. It just says that those are "currently defined capabilities".

> Of what use is MSG_CNT and LOC_CNT?

These were of more importance in earlier times to let people know how many stations the IGate thought should be gated to. It also helped to know how many messages the IGate had gated. These are purely informational.

> What sort of information would be useful?

?IGATE? queries do not occur very often so undirected responses do not greatly impact APRS-IS performance. However, the directed responses have been a problem for the RF side of things but your modifications remove that as an issue.

The information contained in your station capabilities packet is useful. I am sure other things could be determined useful, as well. I would say that this is pretty open-ended according to the spec. You don't want it to be too long, but it is up to the various authors such as yourself to determine what other capabilities would be useful.

LOC_CNT tells me that my RF port is working or at least hearing something on my IGATE when I am on the road. If I see the number drop significantly I know there is an RF, TNC, or communication problem with the computer to the RF side of the port.

MSG_CNT is another indicator to help diagnose a problem remotely. If I see the count increasing and my LOC_CNT is failing, the remote diagnosis would be that the RF port is not working but the TCP/IP port is working.

Are they useful? Only if there is a problem and you are trying to determine which indicators are abnormal. My IGATE is remotely located so I rely on these and other parameters I can request remotely to give a clue if there is any trouble with the gateways operation.

Tim - N8DEU

The original problem with responses to ?IGATE? queries from RF was that the

local channel would be overwhelmed with numerous lengthy replies. Very easy to render a local RF Channels useless if even one of these queries is passed to the Internet and lengthy responses are returned to RF.

Additionally, we need to consider the burden placed on restricted bandwidth connections and the cost to some users for data delivered on the Internet.

> Of what use is MSG_CNT and LOC_CNT?

> What sort of information would be useful?

The information provided should be kept as short as reasonably practical. If users are allowed to add information to those responses, then we will still see extremely long packets. Presently, not unusual to see responses of 250+ bytes from some sysops. I think that most of the other IGATE applications return only MSG_CNT and LOC_CNT..

Bill

I tend to agree with Pete.
To summarize:

Igate receives 3rd party packet from RF.
Do this:

- If it's been igated (TCPIP in 3rd party path) kill it.
- If not, convert to normal and pass it to Internet.

Server receives 3rd party packet from another server or Igate.
Do this:
Kill it.

This can produce a loop if
an application not playing by the rules
inserts a packet into RF from Internet without
TCPIP or TCPIP* in the 3rd party path and
the packet spends more than the duplicate
detector time limit in the RF domain before
it returns to the original Igate.
Are there any known apps that do not
insert TCPIP?

The current situation may be much worse
with most Igates passing 3rd party packets
to the Internet and aprsd possibly wrapping
them into another 3rd party packet and sending
them back to RF.

After some thought it seems it might
be of advantage to simplify the 3rd party
handling procedure.

Igate or server/hub receives a 3rd party packet
from anywhere.

Do this:

If it's been igated (TCPIP in 3rd party path) kill it.

If not, convert to normal and process as any normal packet.

My reasoning is as follows. 3rd party (3P) packets from RF without TCPIP in the 3P header have not been igated. Since 3P packets are not allowed on the Internet System (IS) and there are useful applications (according to Bob) that can only work by wrapping data in 3P format, it's desirable to convert them to normal format.

Most Igate currently pass all 3P packets to servers/hubs unmodified. It can be assumed almost all came from RF. If, instead of killing all of these packets, servers/hubs only kill the ones with TCPIP (has been igated) and convert the others to normal, we effectively upgrade all the old igates. They should be doing it themselves anyway.

Are there any technical or political reasons not to do this?

Maybe we need a switch.
There are 2 possibilities

1. Igate with Internet Connection
2. Igate serving a LAN without Internet Connection

I used aprsd in my shack with 3 clients without Internet connection
and no station or message transmitted fm local Igate received to my APRS
clients

Authors... Regarding PHG circles:

I think it is time to re-do how we display PHG circles on APRS maps.
The present formula is only an approximation and assumes a fixed station
without mobile multipath.

But Mobiles have multipath and the literature suggests an RMS average of
about 6 to 10 dB and frequent 20 to 40 dB fades. If we ignore the
deep and infrequent fades, the 6 dB typical fade translates to a 50%
reduction in range and 10 dB would be a 33% range compared to fixed
stations.

Unless someone has a better idea, I would suggest that authors consider a
dual method of displaying PHG circles separatly for how they would appear
to mobiles and for how they appear to basestations. I'm thinking of using
the 50% size for mobiles...

Possible display options:

- 1) always display both, but in different colors
- 2) Always display the worst case (mobile) circles but have a FIXED station
option.
- 3) Force a Prompt or selection each time circles are displayed.

I will probably do #2 to keep the map clutter down... and to give the
conservative answer to the casual observer.. Or always prompt them to
chose one or the other...

Yes, all of these are crude approximations, but PHG was not intended to be
a hi-fi terrain propogation model, just a simple indication of the first
order approximation of range related to HAAT.

Just a suggestion. But whatever we do, we need to do it consistently so
that users of different software will have the same approximation for
mobiles. Is 50% the right number to use? Or less? Maybe 40%?

This thing allows the users to define
their own data streams. Click this link for documenation.
<http://www.wa4dsy.net/aprs/ports215.html#omniport>

The beta test version is running on wa4dsy.net port 14600
There is a bug preventing "raw" from working.

I just programmed a KPC-3 for WIDEn-N and realize that we should be using the TOCALL to identify the software version using the APNxxx version numbers.. something like APNK83 to show a "Node" using a Kantronics version 8.3 ROM. Put APNK83 in the UNPROTO and in the LTPATH commands.

I would suggest:

- APNK83 for a KPC-3 version 8.3
- APNP83 for a KPC-3PLUS version 8.3
- APN983 for a KPC-9612 or KPC-9612PLUS

Just a thought.
Bob

Here is the current list of APRS TOcalls and Version nomenclature that I have updated. Added several new suggestions for digipeaters under APN and added APB for the little Rabbit TCPIP/controllers.

- APA A-Filter, Alinco, etc
 - APAFxx AFilter.
 - APAGxx AGATE
 - APAXxx AFilterX.
 - APAHxx AHub
- APB Rabbit TCPIP microprocessors
- APC Windows CE, etc
 - APCYxx Cybiko applications
- APD APRSd, etc
 - APDTxx APRStouch Tone (DTMF)
- APE avail
- APF avail
- APG Gates, etc
- APH HamHud, etc
- API Icom, etc

- APICQx for ICQ
- APJ JavaAPRS, JeAPRS, etc
 - APJAxX JavAPRS
 - APJExX JeAPRS
- APK Kenwood, etc
 - APK0xx THD7's
 - APK1xx D700's
- APL Liunx applications
- APM MacAPRS, etc
- APN Network nodes, digis, etc
 - APN3xx Kantronics KPC-3 rom versions
 - APN9xx Kantronics KPC-9612 Roms
 - APNMxx MJF TNC roms
 - APNPxx Paccom TNC roms
 - APNDxx DIGI_NED
 - APNUxx UIidigi
- APO APRSpoint
- APP pocketAPRS, etc
- APQ avail
- APR APR8xx APRSdos, etc
 - APRDxx APRSdata, APRSdr
 - APRKxx APRStk
 - APRS Generic, (obsolete. Digis should use APNxxx instead)
 - APRXxx APRSmax
 - APRTLm used my MIM's and Mic-lites, etc
- APS APRS+SA, etc
- APT TinyTrack
 - APTTxx Tiny Track
 - APT2xx Tiny Track II
 - APTAXx K4ATM's tiny track
 - APTV for ATV/APRN and SSTV applications
- APU UView, etc
 - APU1xx UView 16 bit applications
 - APU2xx UView 32 bit apps
 - APU3xx UView terminal program
- APV avail
- APW WinAPRS, etc
- APX Xaprs, Xastir, etc
- APY etc, Yeasu, etc
- APZ Experimental
 - APZ0xx Xastir (old versions. See APX)
 - APZPAD Smart Palm

Authors with similar alphabetic requirements are encouraged to share their address space with other software. Work out agreements amongst yourselves and keep me informed.

00ps...BAD IDEA. The P should be used for PACCOMM roms. SO here is what I have now penciled into the list of version numbers...

```
APN383 for a KPC-3 or KPC-3PLUS version 8.3
APN983 for a KPC-9612 or KPC-9612PLUS
APNP50 for a Paccomm version 5.0 etc
APNMxx for MFJ, etc
```

One of the last things I need to do before releasing an aprsd215 beta #2 is settle on how packet source tracing and loop prevention should be done. I do not want to simply code and release it. I want some feedback.

After that is settled I need input about Inet to RF 3rd party path construction. Lets do one at a time, with source tracing/loop prevention first.

I have several choices for path tracing.

- 1) No path tracing. Leave the path as is.
- 2) UI-View style. Callsign,I
- 3) qA... construct. Two possibilities for this:
 - A) "qAc,CallSign" c=packet source , Callsign is user logon call or server alias
 - B) "qAc,Call1,Call2,Call3, etc. Same as above except every server or hub adds the users callsign that sent the packet. The path could get quite long.
- 4) Suggestions I have not heard before?

For loop prevention there are three ways:

Note than none of them can stop RF=>Inet=>RF=>Inet loops 100%.

- 1) As it is now. The duplicate detection system stops loops **.
- 2) A time to live counter in the qAc path element. It Becomes qAcN where N is decremented down from 9 on each hop. Packet is discarded when N=0. You can then determine the number of internet hops every packet as taken.
- 3) If full path tracing as #3 above is implimented the path is scanned for duplicate calls and packet is discarded if packet has passed through the same server twice.

I'm inclined to use #3A path trace and #1 loop prevention.
eg: Add "qAc,Call" to packets without a qAc path element.
Change "Callsign,I" style packets to qAc style.
Let the dup detector stop the loops. Note that the dup detector
does not look at the path info so changing it will not create a
Mic_E style multiple packet dup mess. Also see Note2 below.

Example:

Original packet from WA4DSY igate as received at an aprsd server:

N4ZZ>APRS,WIDE:Data

Server outputs packet:

N4ZZ>APRS,WIDE,qAC,WA4DSY*:Data

Packet then preceeds through other servers unchanged.

Original packet from Hub/Server first.aprs.net as received at an aprsd server.

N4ZZ>APRS,WIDE:Data

Server outputs packet:

N4ZZ>APRS,WIDE,qAS,first2C9*:Data

Note also that packets already containing the qAc path element
are not changed.

Note:

The qAc path element is open to future expansion by adding
characters.

Note2:

One other possibility is to also do a full trace (#3B) only on
beacon, ID or Status packets. Query a station and get
back status and full internet path trace.

Brief explanation of the qAc construct:

q is a unique character not ever present in a TNC path from RF.
A is the protocol of the data payload, in this case A=APRS.
The 3rd character indicates the local source of the packet as follows:

C †validated logged on Client user that didn't add his own q
X †un-validated client
R †from RF (TNC)
I †Internal
S †Internet aprs server (old one that didn't put in it's own q)
U †the UDP port on aprsd
Z †Zero hops. Do not repeat this packet. (::USERLIST etc should set this)
3 †3rd party packet converted to normal that has never been Igated TO RF.

Note: The last one "3" is a hack and needs a different solution.

** Currently aprsd and Win/MacAPRS handle 3rd party packets differently.
Aprsd stops them between the TNC recv and the Internet send. If it sees a 3rd party packet on the Internet that it thinks should go to RF it adds yet another 3rd party header and puts it in RF. In other words, just like any other packet.

Win/MacAPRS/XASTIR do not stop 3rd party packets from entering the Internet from RF.

As a result, I believe loops of mutating packets can happen.
RF=>WinAPRS=>Inet=>aprsd=>RF=>WinAPRS---->etc.

Aprsd 215b2 will not contribute to this problem.
The 3rd party handling has been totally reworked.

While I think further loop prevention should be done, I think this should be the result of a working group architecture as opposed to an ad-hoc approach. The current APRS-IS architecture is a 2 to 3 tier architecture with all traffic traveling through the core servers.

With the changes you have made to aprsD (eliminating third-party packets appearing on the Internet side) and javAPRSSrvr also eliminating third-party packets, the opportunity for looping has been greatly reduced. Even with older client software possibly injecting third-party packets, they will be stripped from the APRS-IS stream by the server that they are connected to.

Your method of passing the "meat" of non-TCPIP third-party packets to the Internet is excellent and should be implemented by all IGate software (passing the packet without the RF header).

The qAc method of identification is good and should be considered by the APRS-IS working group (if one gets created). My recommendation, based on other comments made on this SIG, is to append callsign,I* to a packet getting gated from RF. Then, if an IGate on the other end wants to gate it back out, it replaces the I* with callsign,TCPIP* in the third-party header. Of course, currently, all IGates truncate the entire path on

gating to RF and replace the path with callsign,TCPIP*.

I have had family issues that required my full attention this month so I have been unable to move forward on the "current" APRS-IS specification. However, I will begin compiling this during the month of July.

Ah, but Xastir does prevent this!

If you see 3rd party packets getting Igated RF->Inet from Xastir
1.1.2 or later I'd like to know about it. I don't know exactly when
the code was written or patched to prevent this, but it's been in
there for a while.

Perhaps you've seen stations running old versions of Xastir doing this? There are still people running 0.3.6 from various Linux distribution CD's. Perhaps 1.0.0 might allow these packets through as well.

If you see Xastir stations doing this, encourage them to upgrade.

Prince Jokun P. Otonto
NNPC Nigeria

ATTENTION: The President/Managing Director

I am the Director of maintenance for the Nigeria National Petroleum Corporation (NNPC). I have been mandated by my colleagues to look for a foreign organization that would be able to provide an account into which can be transferred the sum of (twenty million five hundred thousand us dollars) \$20,500,000.00.

The funds are the excess of an over-inflated contract that was done for the NNPC and are still floating in NNPC's account with the Central Bank of Nigeria. These funds need to be transferred to a beneficiaries account hence this proposal.

We have agreed that for providing an account you will receive 25% of the funds. For us to proceed we need the following details to process the transfer of the funds:

NAME & ADDRESS OF YOUR BANK
ACCOUNT NAME
ACCOUNT NUMBER

With the above information it will take 7 working days to transfer the funds to your account.

As we are senior officials in our organization we have arranged this deal to be hitch-free.

We also wish that you would in turn keep this business confidential.

Please reply by providing us your private e-mail address, fax and phone numbers for easy and confidential communication.

Please reply at jpotondo@rediffmail.com

Looking forward to doing business with you.

Yours sincerely

Prince Jokun P. Otondo

The question: How do I know which stations are capable of digipeating on what aliases?

The answer: it is impossible to know without a careful analysis of the data that they see and watching what they do with it...and knowing the 'personality' of each digipeating alias.

Bob has suggested the use of an overlay character on each digipeater, in the hopes of identifying it's "Network Personality". I would like to expand on that concept a bit, before it becomes too entrenched to modify (should the APRS community agree that what I'm proposing has merit).

First, identify all of the possible personalities that could be exhibited. In the APRS world, I think they are as follows:

RELAY Digipeater
WIDE Digipeater
TRACE Digipeater
WIDEn-N Digipeater
TRACEn-N Digipeater
GATE (connects two RF-based APRS frequencies ie 2m<->30m)
IGATE (connects APRS to the Internet Stream)

Assumption: Non home-based Digi's are rarely (if ever) also GATE's and IGates. If this is true, then remote digis would continue to use the green star icon, while GATE and IGATE stations would use another icon entirely.

Provided that I haven't missed one or two, this is a perfect example of where 5-bit encoding can work wonders in an overlay.

twTWR R=Relay,W=Wide,T=Trace,w=Widen-N,t=Tracen-N,
12345 G=Gate,I=IGate and 12345 is the Bit-position of
a single byte...the overlay character. (!)

Using such a system, one can easily identify all digipeating aliases that any given digipeater can respond to!

R,W,T (no n-N) = 00111 binary -or- "7" in BASE36

If you see a green star with a "7" overlayed, you know it is capable of RWT only.

A Kantronics could be setup as 11111 binary -or- 31 decimal -or- "U" in BASE36. Such a digi would show an overlay of "U".

In California, maybe it's 11110 binary (no RELAY) -or- 30 decimal -or- "T" in BASE36. Get it?

Any combination of these 5 digipeating aliases could be displayed for

everyone on the network to see.

This is simply food for further discussion.

Kind regards,
Ev, W2EV

The present overlay is for rapid human consumption and really is only a
few types with probably these distributions:

N - 80% (some of these are the "I" type)
T - 10%
W - 3%
R - 2% And others being another 5% (guessing only)

Users should all know what these mean. So I do not want to mess with that present system. But I do like your concept for adding in the position comment field. In the early days (before the overlay character) we asked for the words "WIDE" or "RELAY-WIDE" or "TRACE" in the comment field. But with all the options now, that becomes unwieldy. Your suggestion for a summary few bytes has merit.

Bob

AUTHORS:

In my latest release of APRSdos, I have cut the PHG displayed circle radius in HALF to better display the usable range to DIGI's to/from mobiles. This is not an arbitrary choice, but founded on the well established multi-path models for mobiles.

So now by default, users see a more realistic display (the MOBILE display). User may still optionally select the "FIXED" display with one more keystroke, but since this is so unrealistic to the normal and intended uses of APRS as a tactical system, it does not come up first.

I would like to ask all AUTHORS to consider doing the same...

On Mon, 24 Jun 2002, Bob Bruninga wrote:

Makes sense for me, but..

Shouldn't we be working toward a single setting that works everywhere?

I like it in that it identifies what the digi can do, but my KPC-3 tracker
can't adjust itself to conform to the nearby digi. (without yet another
kludge-box)

If all high level digis at least responded to relay and wide, and would
take WideN-N if only as "wide", then you could set a path of Relay,Wide3-3
and always at least make two hops, anywhere.

I just finished adding an internet APRS weather report feature to Davis Instruments' WeatherLink program.
This feature generates APRS packets from a weather station (and user entered Lat/Lon info) and sends them
via the internet to an APRS server. This feature was added at the request of
and to support NOAA's Citizen
Weather Observer's Program.

I had a couple of comments about the APRS101.PDF documentation file you may
want to consider for the next
time you release a new version.

1. In section 12, page 64. You describe the Positionless Weather Data format
and state that wind speed values are
in MPH. On page 65, for "Complete Weather Reports with Timestamp and
Position" you state that "... the 7-byte Wind
Direction and Wind Speed Data Extension replace the "cccc" and "ssss" fields
...". Back on page 27 the definition of the
"Wind Direction and Wind Speed" data extension says that wind speed should
be expressed in knots. This will result in
inconsistent units (i.e. the current wind given in knots with the wind gust
given in mph). Both findu.com and NOAA want the
wind value in this case to be in MPH.

2. Again on page 64, It is really hard to tell which rain field is supposed
to use the lowercase "p" and which is supposed to
use the uppercase "P". It is possible to choose a different font so that it
is more clear?

3. This software works on Davis' new line of weather stations, the Vantage
Pro. I am using "DsVP" as the Weather Unit Type
and am submitting it as a candidate for the official list.

4. What should I do about the APRS Software Type field? I know that there is
at least one other software package in the same niche
as mine (i.e. generating APRS weather packets for internet distribution, but

only as a small part of a general weather display
and data management program). I am using a "." (period) for now.

Thank you for your consideration
Edward Blair.

Findu:
Compare <http://www.findu.com/cgi-bin/wxpage.cgi?CW0538>

Where it says: Wind from 268 degrees @ 8 MPH

and <http://www.findu.com/cgi-bin/find.cgi?CW0538>

where the raw packet is

CW0538>APRS,TCPXX*:0052343z3738.17N/12207.50W_268/008g...t062L637P000h68b10125.DsVP

Clearly findu did not convert the wind speed of "/008" from knots to MPH but took the value as is in MPH. (8 knots = 9.2 MPH which would round to 9 MPH)

NOAA:

My contact is Russ Chadwick at the Forecast Systems Laboratory in Boulder Colorado. When I asked him this same question he said:

"All wind speeds should be in miles per hour. While the APRS IS specification says knots, note that relates only to velocities of objects. Elsewhere in the spec, it says that wind speeds should be in mph and that is what we expect."

I don't know exactly where he is referring to, but the positionless weather record specifically says MPH. And near the beginning there is a general warning that different wind units are used in different contexts.

My point is that it would not make sense for a weather report to have the current wind speed in knots and the wind gust in MPH. On the other hand it is not good to use knots for the wind speed in the data extension EXCEPT when the packet is a weather packet.

I am not clear about why the complete weather packet can't just report the timestamp and location without a data extension, and then use the positionless weather format (i.e. "c268s008") to report the wind direction and speed in MPH.

Who says "Both findu.com and NOAA want the wind value in this case to be in MPH"? Does the Citizen's Weather Program directly conflict with FMH-1, which in Chapter 5.5.1 clearly states that all wind observations will be reported in KNOTS.

Sorry for the change in subject title...it's a loooong story. :o)

> Any combination of these 5 digipeating aliases could
> be displayed for everyone on the network to see.
>
>This is simply food for further discussion.

Makes sense for me, but..

Shouldn't we be working toward a single setting that works everywhere?

I like it in that it identifies what the digi can do, but my KPC-3
tracker can't adjust itself to conform to the nearby digi. (without yet
another kludge-box)

These are two different issues. One is being able to see, at a glance,
what the network is like within your range. The second is assuring
operational ubiquity.

By landing on a common icon-overlay scheme, one can tell...at a glance
many useful things:

- o your best path to get to a WIDEn-N digi (IF there are
any in the area)
- o your best path to get to an HF gate (IF there are any)
- o your best path to get to an IGate (ditto above)

With a very small amount of sleuthing, you can find out who is using
that archaic non call-substituting ROM.

There hasn't been alot of comment on this proposal, other than from Bob,
but I honestly hope that it doesn't die. It is one of the biggest needs
of the general APRS service (besides someone writing UnIversal Engine,
that is <smile>). It is built-in to the BEACONet protocol (and

implemented using the bit-encoding method previously described), but it's alot like SSID routing (in the protocol, but not implemented yet). :o)

The method of getting there is unimportant...the need to get there is universal. Bob's proposal, though 'less specific' than the bit-level encoding scheme that I proposed, is certainly easier for 'human decoding' (which is a good thing).

Your issue of re-establishing "path ubiquity" is quite important, as well...but a different issue. Other than having some digi's out there that "can't" process WIDEn-N, I'm not certain I yet understand why this can't be accomplished (a continent-wide RELAY,WIDE3-3 ability). Even then...I have some thoughts as to what to do with those old TNC's, too...but before I share that, I'd like to know how many we're talking about. :o)

I agree. I guess I'm just worried that the ability to work around the old digis will turn into a crutch for keeping them. I certainly agree with your method.

The APRS spec actually is pretty specific, but you need to look in two places. Russ is actually incorrect in his interpretation per discussions on this subject on a couple of years ago. The positionless weather packet has all speeds in MPH (as discussed already).

The "complete" weather packet makes use of an APRS data extension (chapter 7). As stated in chapter 7, the SPD portion of both the "Course and Speed" and "Wind Direction and Wind Speed" are in knots. This was done (I am assuming here) so an APRS decoder only needs to know one method for decoding the data extension since there is no differentiator between the two extensions (other than the icon symbol found elsewhere in the packet).

Findu should be converting the speed, as well.

Hope this clarifies things a little.

Is it different than the existing WX fields? Show us the format.

Thanks

Actually, I would say the SPEC is in error here. The complete WX packet just conveniently uses the same BYTES for WIND DIR and SPEED as it would normally use for COURSE and SPEED in an object or position report. But the definition of what that byte means is "Knots" if it is an object or position, and MPH if it is a wx report.

At least That's the way it is supposed to be.

Another reason for the working group to assemble an updated specification (possibly create an online addendum that the WG can keep up-to-date and where developers such as myself can go so we won't have to guess if the spec is correct or not). When I asked these same questions 2 years ago, I was told to use knots for a complete weather report and mph for the positionless report.

Also, while you are creating a specification addendum, note that the section on compressed packets also says that speed is in knots. I would guess, from your statement about the spec being in error about the data extension for weather reports that this is also in error regarding complete weather reports using compressed lat/lon format.

Yes, back when we did the WX stuff, we were told that WX should always be in MPH...

A new public beta of aprsd 2.1.5 is up on wa4dsy.net.

Download it at:
<http://www.wa4dsy.net/Files/aprsd215b2.tgz>

Documentation is here:
<http://www.wa4dsy.net/aprs/aprsdDOC.html>

REVISIONS

2.1.5

Note: Some of these bugs were caught by the new compiler in RedHat 7.

1) Fixed charQueue.write statement in serialp.cpp. Now it passes the char as an integer in the cmd field.

It used to pass the char as a char pointer. This worked but was confusing.

2) Fixed charQueue.read() statement in aprsd.cpp. Now it reads the int cmd and

then converts it to
a char. (see #1 above)

3) aprspass.cpp: Added to the #includes list "stdlib.h" so it now compiles on RedHat 7

4) added a missing pthread_mutex_unlock() in SendFiletoClient(). Possible cause of lockups!

5) Fixed several instances where I had incorrectly used strncat. strcat is now used instead.
Checked for buffer overflows.

6) Changed the way the number of connected clients is determined. Now the sessions[] array is searched and active connections are counted each time this value is required. The previous code had a counter "ConnectedClients" which sometimes got out of sync with reality.

7) Fixed many instances where ostream objects could create buffers without terminating NULLs
if filled beyond capacity. (no overflow, just an unterminated string)

8) Fixed bug in Mic-E converter that rejected latitude decimal minutes greater than .59 .

9) Added filter code in serialp.cpp to prevent ?IGATE? and ?APRSD? queries from being
igated from RF to the internet where dozens of replies could be generated.
APRSD still
responds to the RF station but doesn't pass the query to any other igates.

10) Applied patches from Steve Price (KG4PGU) to make code more portable.
Didn't change to gethostbyname2_r() though.

11) Release a9: Worked on code that used gethostbyname2_r(). Removed mutex locks. Added a test for return value == 0 in addition to hostinfo pointer not being NULL. Will this fix the crashing problem?
Answer, after a 500 hour test: NO!

12) Release a10: Replaced gethostbyname2_r with gethostbyname_r.

13) Added filter code in aprsString to reject "EH?" and "cmd:" packets.

14) Added "try" "catch" blocks to aprsString::AEAtoTAPR, split() and aprsString::changePath().

Now exceptions there will be caught instead of segfaulting.

Note there was no solid evidence these functions ever caused a segfault.
Safety first.

15) 5-19-02 Removed directed query responses. Fixed general query "?IGATE?" response to comply with
APRS spec 1.0.

16) Stopped sending System Status messages on Link port (1313), Message Port (1314)

and to Hubs you have connected to. You will no longer get:

"aprsdATL>JAVA::javaMSG :Atlanta_GA Linux APRS Server: 127.0.0.1 connected 2 users online."

and other such messages on these ports. The BEACON packet will still go to all ports

except the 1314 message-only port.

17) Added support for NOGATE in path. If a packet from any source has NOGATE or RFONLY in the

path it will be killed and not go onto the Internet. However, they will still appear

on the raw TNC port (14580) for network debugging.

18) The server now adds information to the end of the PATH indicating the source of each packet. This is the qAc,CallSign construct.

See server docs for more details.

19) In the code that creates connections to other hubs (Server command) I added code to check that the sysop of THIS hub provided a valid passcode. If not valid

no data will be sent outbound.

20) Added error checking in thirdPartyReformat(). It now returns an error if packet wasn't valid AX25 or was already in 3rd party format.

21) Fixed problems with 3rd party packet handling.

Now it works this way:

A) Third party packets that have TCPIP in the 3rd party header are rejected.

B) Third party packets that don't have TCPIP are converted to normal format and put on the internet stream.

22) Restructured the aprsd.cpp file into three files. All the aprs server thread code is now in servers.cpp. The http server is in httpserver.cpp.

Also cleaned up a lot of sloppy usage of extern declarations.

All externs are now in include files.

- 22) Added signal handler for SIGINT to allow graceful shutdown when running as a daemon. Issuing a "killall -INT aprsd" command properly loads RESTORE.TNC into the tnc and stops aprsd. Also, "service aprsd.init stop" will properly shutdown aprsd.
- 23) Added new keyword "Server" to aprsd.conf file.
It replaces the old "Igate" command (although Igate is still honored).
A command such as "server first.aprs.net 23 hub-sr" defines the connection to first.aprs.net as a send/receive hub connection. The user passcode is supplied with another keyword "pass". See aprsd.conf docs for details.
- 24) Added a new class of port. OmniPort defaults to 14600 and allows the USER to control which data streams he wants via messages or plain ascii commands.
- 25) Added a new page of data to the html status page. Clicking on the users port number opens port filter status in a new window. There you can observe which streams each user is being sent. This became important because of the new OmniPort and its user definable streams.
- 26) Added bandwidth controls. Sysop may now specify the maximum allowed server load in bytes/sec. New users are rejected when the limit would be exceeded and the latest high bandwidth users are disconnected if the load increases beyond the specified limit. Keyword is "MaxLoad" in aprsd.conf .
- 27) TNC sysop mode can only be accessed from the new TNC Sysop Port 14500.
Aprsd will now automatically put your telnet client into character-at-a-time mode for better operation with the TNC command line.

After receiving some feedback about aprsd215b2 and
discovering and correcting some minor C++ syntax problems
caught by other compilers I have released another beta.
If beta 2 did not compile for you try this one.

Has consideration been given to creating a Varicoded message format in APRS?
Given that APRS is designed as a "tactical geographical system," the current
Message data type seems to risk channel overloading by limiting Messages and
Bulletins and Announcements to 67 characters per APRS packet. Users must choose
between possibly excessive abbreviation of free-form information, or sending
multiple packets to convey information that the highly compressed position, WX,
etc. data formats do not cover.

As a possible means of implementation of Varicoded text transmission, could one
of the presently unused Data Type Identifiers like: "^" or "\" be used to
indicate text Varicoded along the lines of Peter Martinez's (G3PLX) PSK31
alphabet? Any version of APRS that didn't recognize the Data Type Identifier
would just fail to display the transmitted text, but Varicode-enabled APRS
software packages would allow their users to send up to twice as much free-form
text in a single packet.

I await your replies swathed in Nomex.

aprsd 2.1.5 beta 4 can be downloaded here:
<http://www.wa4dsy.net/Files/aprsd215b4.tgz>

This version compiles with the new GNU C 3.1 compiler.
It also still compiles with 2.95.

I also made doing Mic-E conversions more difficult.
The sysop must not only set "ConvertMicE yes" in the
aprsd.conf file but also change "#define CONVERT_MIC_E FALSE"
to "TRUE" in constant.c and recompile.
I added a new status field on the port 14501 html status
page "Mic-E Conversions YES/NO".

So far there have not been any reports of problems with
beta 3. If beta 4 does not generate any significant

negative reports I'll release aprsd 215.

Let me flesh out my idea a bit further. I am proposing a new
Message/Bulletin/Announcement Data Type Identifier - let's say "\" to indicate
Varicoded Messages, etc. The max. size is still 67 bytes, so more characters
would generally be available for messages given the usual distribution of

characters in message text. I suggest the use of G3PLZ's varicode alphabet, which would be interpreted by enabled APRS clients just like ASCII, since lookup tables are used for either ASCII or a Varicode to translate binary strings into text. The legacy message type, indicated by a DTI of ":" would remain in use to permit messaging to older client types. As a matter of convention, NOT specification, Bulletins and Announcements should not be Varicoded until Varicode-enabled APRS clients are the norm. G3PLZ's Varicode alphabet seems like a good fit because it was developed from character frequencies in English, not QSOs. Much of what is passed in a QSO is already encoded elsewhere in an APRS packet - e.g., callsigns, QTH, WX, etc. Varicoding messages could enhance the tactical utility of APRS by permitting longer free-form messages within single packets, which would help prevent channel congestio

The varicoded payloads will not be decodable by Kenwood D7, D700's and (I think) HamHud etc.

It is also possible that some existing client applications may encounter difficulty when receiving these packets. For example, when any of the varicoded text happens to include character sequences that resemble standard APRS constructs.

Some Replies:

de KC9XG:

>The varicoded payloads will not be decodable by Kenwood D7, D700's and (I
>think) HamHud etc.
>It is also possible that some existing client applications may encounter
>difficulty when receiving these packets.

True. The D7, etc. seem to be hard-coded to decode only ASCII messages, etc.
That's why I recommend using a new Data Type Identifier for Varicoded text and
keeping the legacy DTI for ASCII-only recipients. However, if a new DTI is used
for Varicode I thought that incompatible clients would reject text following the
new DTI.

de Wes Johnston:

>The problem with this, ... is that some of those 8bit bytes would be
>non-printable ascii characters. Like MIC-e packets they would get clobbered in
>the internet system.

Isn't protocol translation a function of a gateway server? In any case, I am
trying to wring a bit more use from the severely constrained 1200 bps AFSK
environment most hams use. If we need to fix our gateways to the Internet, that's

a separat

Some clients will look for APRS constructs in a payload regardless of the DTI.

The mangling of 8 bit characters by TNC's, IGATEs and servers takes several forms. An 8 bit char may be deleted entirely, replaced with a space, or be converted to 7 bit. It is quite common to see the original raw Mic-E packet and one or more of the mangled packets on the IS. This mangling also affects messages in languages that use 8 bit characters (Nordic etc).

The APRS IS and all client applications expect that a packet will be terminated with a carriage return or carriage return and line feed. Not sure if it is possible for a carriage return to appear in the middle of a varicoded string. Perhaps there is some method to preclude this from happening?

> a separat

Protocol translation of Mic-E packets proved to be a dismal failure. There was no specification for the creation of the converted packets. Each application constructed the packet differently. Some had mixed case, some upper case, etc. Some applications added unique identifiers. Incorrect decoding of raw Mic-E packet location information are still seen.

Protocol translation differences, errors or mangling of 8 bit characters of a single packet causes multiple raw, mangled and converted packets to appear on the APRS IS.

The conversion of Mic-E packets is no longer recommended for the above

reasons.

What form would the conversion of a varicoded APRS message packet take?

Would the conversion result in the creation of one or more APRS Spec 1.0 compliant messages with a maximum payload of 67 bytes? If the conversions were gated to RF, you would have the original varicoded message and the converted packets being transmitted along with any mangled versions of packets that contained 8 bit char.

Any changes to the spec should be backwards compatible with existing applications. It has proven difficult, if not impossible, to get users to upgrade to current versions of APRS applications. Changes to firmware based units would be even more difficult, and expensive.

Bill KC9XG

I've received reports that betas 4 and 5 do not compile on RedHat 6.2. This was caused by a change in the makefile to stop GNU g++ 3.1 compilers from emitting lots of "deprecated" warnings. I've turned back on all warnings so RH 6.2 will be happy. Also I've tweeked some documenation. We are getting real close....

Not wanting to rain on a good idea, but...

Isn't the average varicode about 5 bits? And since APRS currently uses 7 bit ASCII, this would mean that a 67 byte long APRS message could be extended by only about 28 percent to say about 85 characters...

It seems to me that the payback of having 85 character lines instead of 67 byte is not much compared to the difficulty of implementing a system that would have to be phased in over a long period of time...

Bob

TAPR members:

Here is your chance to become rich and famous! Well, maybe not rich, but certainly famous.

The editorial board of Packet Status Register (PSR, TAPR's quarterly newsletter) is now soliciting articles, news items, etc. for the next issue of the newsletter. Topics related to digital Amateur Radio will be given preference and the editorial board reserves the right to determine what is suitable for publication.

E-mail your contributions to wallou@tapr.org ASAP because the deadline for the next issue of the newsletter is July 24.

73,

Stan Horzepa, WA1LOU, PSR Editor

I have received all the names that have made donations to the backup server.
If you are missing or have a correction, email me off the list servers. I also found out last saturday that there were a few checks still not run. That was taken care of early this week and pushed the total to \$6700.

I wish I could tell everyone that the server is in but I found out that the original cart we had created expired. That occurred due to the delay in finding the 501c3 document. The document will allow Dell to give us a break on the sales tax. Dell will quote the final price when they get the document.
The treasurer for the DCARA was on vacation the week I found out that the cart was fixing to expire. We have all the documentation in place and a much higher amount that we had when the cart was built for the order.

Additional delays that have occurred have been the results of work, 2 bike rides (MADD and MS150) family and other assorted "disasters" that life deals out.

Let me talk about the server instead of excuses. Clint Miller , KD5BYY is going to be the primary admin on the server. We will be third and I am looking for someone to act as the secondary. That person will need to be very knowledgeable about Linux, Apache and sql databases. I have had some discussion with Steve about the redundancy levels. Clint is an owner of Itel-Tigerbyte and specs out all our equipment. The backup server will be featuring tape backup and a small raid array. If a system failure happens and it takes out the data disk and it's raid mirror, the tape backup will

save that data. The server is not going to be built by Dell with all the memory that is planned for it. Dell is very proud of it's memory upgrades and we can beat the pricing by using local vendors for memory. We originally wanted to get a rack mountable system but that costs more than it is worth.

It is amazing what a rack mount form factor can do to cost. It will have a dedicated battery backup and will talk to the UPS so if it needs to shut down, it can do so in an intelligent manner. Last thing we want is to see a corrupt database due to a bad shutdown.

The server will be located at the co-location facility in Dallas Texas. It will be connected via a T1 that links back to the Denton office. The Denton office is feed by a buisness class 1.5 megabit DSL circuit. The Dallas Co-location facility also has redundant power and generator backup.

When I have the cart that is ordered I will post it to the lists so you can see what your donations purchased. Pictures will also be posted when the server arrives.

Many hams contacted me directly offering to help purchase or find a location to make the server home. Thank you everyone for your offers. They were not ignored or treated lightly.

I want to thank everyone for being patient in this endeavor. It has taken longer than anyone expected, but then again, it has exceeded most peoples wildest expectations. It will be worth the wait. Spider has been instrumental in the donation collection process. Over half the collected donations were routed through him. Jim, I was not joking when I said you won the race. Brent was also a major source of donation collections with his generous offer. TAPR, as always, was a great helper and sport. We all owe these guys a big thanks at this time. The most important players have been those of you who were able to make donations. Pat yourselves on the back. You deserve it.

A new public beta of aprsd 2.1.5 is up on wa4dsy.net.

Since the last aprsd beta release no. 7,
Pete Loveall and I have worked out some additions
and improvements to the new q construct. These
changes are now in beta 8. Please upgrade
all previous aprsd betas so your servers will
be 100% compatable with the core servers.

Download it at (188K):
<http://www.wa4dsy.net/Files/aprsd215b8.tgz>

Documentation is here:
<http://www.wa4dsy.net/aprs/aprsdDOC.html>

I'd like to formally request that the following be considered by those
"in the loop" in making these decisions...

== The issue ==

The way that icon determination for 4-cypher Grid-in-Status
transmissions is ambiguous and can lead to unintended result, unless
clarified.

== Example ==

This is a 6-cypher grid w/icon & overlay identified (no ambiguity):
>FM19XXBV will display the "V" icon with the letter "B" overlaid

Is this a 4-cypher grid w/icon & overlay or is this a 6-cypher grid with
a forgotten icon & overlay? (ambiguity):
>FM19XX will display the "X" icon with the letter "X" overlaid

== Suggested Solution ==

Require 6-cypher gridsquare for Grid-in-Status when icon & overlay is
desired

- o When no icon & overlay is included, display as gridsquare icon
- o When only 4-cyphers are used, accept and display as gridsquare icon

Respectfully,
Ev, W2EV

I agree. The >GG##gg/\$ construct was only meant for the full 6 digit
gridsquare. If the full 6 digits are not known, then I think the letters
AA or something else were supposed to be substituted....

Thanks
Bob

Speaking for myself, Ev, no interest. I've never supported
grid-in-status and in four years nobody's noticed it isn't there. So
it's moot as far as I'm concerned.

Sorry. :-(

...mike

I think I also missed it. However, I didn't think there was any ambiguity in the spec regarding 4 character and six character grids. Or perhaps I'm forgetting what Ev originally asked?

Hi Mike,

That makes sense to me from a code writing standpoint. I guess I'm asking from a protocol perspective, should an author (present or future) wish to invoke the function. Thanks for the reply, though. I wasn't sure how to interpret the silence...and now realize that Lyris burped at about the same time as I floated the question.

Appreciate your reply.

Best wishes,
Ev

> perhaps I'm forgetting what Ev originally asked?

The ambiguity occurs when a 4-cypher grid is sent, using grid-in-status. I discovered it as I was designing a new set of icons to release to the BEACONet

community (where we use GR##ID exclusively)...

>GR##IDoI will display an icon associated with "I" with an overlay of "o".

>GR##ID is ambiguous as one doesn't know if the intent was to send a 6-cypher grid without an icon or overlay expressly chosen or if it is a 4-cypher grid with an icon of "D" and an overlay of "I".

I offered the suggestion that the grid-in-status spec consider requiring 6-cypher grids and to display as /G if there is no icon/overlay shown...but am more interested in removing the ambiguity than necessarily getting stymied by how that is accomplished right now. I was suprised by the lack of comment on it, but then realized that the Lyris system "burped" at around the same time and many may have missed the post.

Best wishes,

Ev, W2EV

Have a read of section 16 of the APRS spec. You will see that the
table/overlay and symbol characters must be included, they are not
optional. If you only send a total of six characters, then it must be
interpreted as a four character locator.

So APRS still does not have a GRIDSquare format that can be received by
all software... what a shame... :-(
And of course, no user who does not see it will not know that he isn't
seeing it, so how will he know to complain..

Bob

Yes, that is the correct interpretation too...

In my aprsworld.net software I use the following algorithm:

extract the 2 letter / 2 digit square

then

if next two letters are both upper case then I assume it is a 6 character
grid square.

Here's the code:

```
void extract_gridsquare (struct position *pos, char *square) {
```

```

int i;
int len = strlen (square);

if ( verbose & 4 )
    printf("Extracting grid square\n");
if (square[0] >= 'A' && square[0] <= 'I') {
    pos->longitude = (square[0] - 'A' + 0) * 20 - 180;
} else {
    pos->longitude = (square[0] - 'J' + 0) * 20;
}

if (square[1] >= 'A' && square[1] <= 'I') {
    pos->latitude = (square[1] - 'A') * 10 - 90;
} else {
    pos->latitude = (square[1] - 'J') * 10;
}

pos->latitude += (square[3] - '0');
pos->longitude += (square[2] - '0') * 2;

if (isupper (square[4]) && isupper (square[5])) {
#define LAT 0.0416666
#define LAT_HALF 0.0208333
#define LON 0.0833333
#define LON_HALF 0.0416666
    pos->latitude += (square[5] - 'A') * LAT + LAT_HALF;
    pos->longitude += (square[4] - 'A') * LON + LON_HALF;

    for (i = 0; i <= len - 7; i++)    // Swallow grid square and space
        square[i] = square[i + 7];
} else {
    pos->latitude += 0.5;
    pos->longitude += 1;

    for (i = 0; i <= len - 5; i++)    // Swallow grid square and space
        square[i] = square[i + 5];
}
}

[WARNING - Working for myself has been brutal and I have not been getting much sleep lately; the bags under my eyes have become steamer trunks. So I'm currently running at about S9+20 on the grumpy meter... just ask my wife. Given that caveat:]

>So APRS still does not have a GRIDSquare format that can be received by
>all software... what a shame... :-(

Consider it a volley in my quixotic "war against the arcane", Bob. Maidenhead is a poster child for "arcane" in the first place. Then we come along and create an exception-to-the-exception rule putting position data in static informational text to accommodate a >0.01% usage in an experimental context. Arcane ^ 4.

I'll be even more blunt - if somebody is taking the time to compute, generate or otherwise figure-out 6-digit Maidenhead coordinates, they have a GPS in their hand. If they have a GPS, cut the BS and transmit lat/lon.

>And of course, no user who does not see it will not know that he isn't
>seeing it, so how will he know to complain..

That's not the way it works, especially with my application. Folks run pAPRS as a second station, usually mobile. So they frequently have the opportunity to compare what they see on the handheld to what they see on the desktop... and I usually hear about it when there's a

divergence. I have NEVER heard from a user (and I checked!) about grid squares in the four years the app has been around.

...mike

That makes sense to me, too. I knew I'd get the straight scoop if I asked.

Thanks, guys.

Kind regards,
Ev, W2EV

Mike,

This is probably about to change. I'm now deeply involved in a discussion among
microwave testers in which the topic of BEACONet.25/APRS has caught fire (in

a very positive way). These are people who live-and-die by 6-character gridsquares and operating from remote locations using Palm Pilots to log contacts. To date, all I've suggested using is a laptop and UI-View, because it (and APRSdos) is the only APRS software that behaves in a way as to make it VHF narrowband (read: BEACONet) friendly (a number of reasons, which are beyond the scope of this note).

I guess it's time for me to download pAPRS and play with it's [GG##gg] personality to see if it is friendly, too. The whole UI-Frame concept is misunderstood by a vast majority of ssb/cw VHF operators. I've finally made an inroad to a community that is starting to see the value of using it to *support* their interested (not replace it). You may see more action on pAPRS and grid support as a result.

Ev, W2EV

Ok, but my problem comes about when I have to give recommendations to AMSAT and other packet operators and users of PCsat, UO22, and ISS as to what to use as the fundamental simple PACKET beacon? I can assure you that the one and only HAM radio acceptable lowest common denominator is grid square.

It is the SPACE and Meteor Scatter and other DX applications of APRS that are the only significant reason why I care at all about grid square. And as you know, working the satellites with packet (and APRS) has been my forte for the last several years...

If I try to tell AMSAT folks that they have to use an APRS formatted packet or a GPS LAT/LONG, then it raises hackles and anti-APRS sentiment. Gridsquares have been used via SAREX, MIREX and now ARISS as the defacto default since we launched the first packet digipeater back in 1990. So it has always been easy to just say "transmit your GRID square and oh, by the way, put a ">" in front of it and then everyone with APRS and a kenwood will see you too.... and add a"/X" on the end if you want to indicate your house, car, motorcycle, etc...

So I agree completely with your conclusion, that this is a 1% of 1% APRS application, but on the other hand, it is closer to 90% of everyone on the satellites... It is very frustrating for me that I cannot tell AMSAT a single format that all APRS software will plot. Same goes for meteor scatter and now BEACONNET. Kenwoods cannot tune to the BEACON NET frequency and copy anything, because they changed two bytes in the TOCALL....

Same goes for APRS omni-DFing. It is a very very powerful means to locate a jammer nearly instantly without anyone anywhere having any DF equipment. And it is only used 1% of 1% of the time... but when you need it, it should be there...

I am disappointed that none of the other authors have implemented this fundamental APRS technique... No, the users haven't asked for it, because unless they used APRSdos, they don't know of its power. And since no one enters APRS on APRSdos anymore, but usually come in through a windows application, they have a limited, and skewed view of what APRS is supposed to be able to do....

To see what the OMNI-DF screen (based inversly on PHG) looks like see:

APRS DFing... <http://www.ew.usna.edu/~bruninga/dfing.html>

Can I be blunt, Bob? (Remember - you were warned that I was grouchy!)
Most of us who are deeply involved in APRS are doing so because of
its core application, AVL, with equally important uses in WX object
communication. When DX beaconing and the satellite stuff usurped the
discussions you seemed to be completely oblivious to all the eyes
rolling back.

While the rank-and-file were concerned with trying to solve the
problems of AVL, network management and the Internet side, you were
off in the woods somewhere pointing a beam skyward. That's fine, and
more power to you, but your attempts to transmogrify all of APRS to
fit your current interests have fallen on a lot of deaf ears. With
due respect, trying to make us feel guilty over issues that a lot of
us frankly don't care about just can't be very productive.

>So I agree completely with your conclusion, that this is a 1% of 1%
>APRS application,

So the problem is...?

>a jammer nearly instantly without anyone anywhere having any DF
>equipment. And it is only used 1% of 1% of the time... but when you need
>it, it should be there...

You are making a serious mistake bringing this one up with me. Did
you not pay any attention at all to our quiet little chat three
Days ago? I was quite startled when you resumed beating this drum
a few months back, but I bit my tongue.

Anyway, I distinctly recall taking advantage of a lull in the booth
traffic for this. I told you that from years of direct experience,
I've learned that by the time a "network" of ad hoc receive stations
QSY and resolve their lack of calibration plus the terrain and

propagation anomalies to get the *first* approximate reading, one person with narrow-aperture RDF tools has found it, fixed it and is already relaxing at home with beer in hand.

Using APRS like this is like pounding nails with a wrench. There is a better, much more effective tool, and, yes, thank goodness, you had the foresight to accommodate that better tool as well.

>I am disappointed that none of the other authors have implemented this
>fundamental APRS technique...

Is there maybe a message here? My gosh, I'm the only one besides you who even supports the on-air protocol for vector DF, a fact that has not been lost on the serious RDF fraternity.

For those of us who actually know RDF, "omni DF" is a complete non-starter. Sorry to burst your bubble this way; don't forget that I did at least try to do it "offstage".

: -/

I guess if there's one general piece of advice I can offer, it's to stop trying to make APRS into "the Swiss army knife of ham radio". Swiss knives are great for the infrequent quick fix, but try to do anything serious and you'll bust your knuckles. Let's concentrate on refining what we do sort of well and not heap more stuff on a clogged system just because we've managed to fabricate a faint connection to another prospective application.

...mike

Ah, but these people with rolling eyes do not understand APRS!

APRS is a tactical real time digital packet communications system.
Remember, APRS stands for Automatic Packet Reporting System. It was
designed to provide a common definition of UI packets that would convey
meaningful information to everyone on frequency. It was intended to
provide a means to communicate digitally, EVERYTHING of interest to the
fixed or mobile operator that was REAL-TIME... AVL is just one part of
APRS...

Yes, when GPS became cheap we also referred to the "P" as position
reporting. But in no uncertain terms, APRS is not "an AVL system" only.
Never was. It is this tendency for HAMdom to keep trying to stuff APRS
into an "AVL" box that is limiting our ability to communicate digitally
and people's understanding of it... APRS should be able to convey to ALL
users in its local area QUICKLY, ANYTHING of interest to everyone in that
area. From the beginning, that included typical HAM radio interests of

AVL, WX, DFing and DX.

> While the rank-and-file were concerned with trying to solve the
> problems of AVL, network management and the Internet side, you were
> off in the woods somewhere pointing a beam skyward.

Me thinks you may be the one lost in the woods....

An AVL system based on fixed stations using a fixed plant Internet linked system without satellite access, leaves 95% of the planet with NO connectivity. Even now, 80% of the area of the USA has no APRS network. But with Satellites, we get coverage for any HAM anywhere worldwide at least 12 times a day.

A narrow definition of APRS that will only work in the population centers of the USA and then only under personally defined terms of what constitutes an AVL system seem to me to be missing the mark...

> That's fine, and more power to you, but your attempts to transmogrify
> all of APRS to fit your current interests have fallen on a lot of deaf
> ears. With due respect, trying to make us feel guilty over issues that a
> lot of us frankly don't care about just can't be very productive.

Grid Square formats were in APRS from 1993. I counter that they are not "current" interests other than my 9 year frustration that late comers to APRS are not fully implementing what APRS was designed to do and this leaves the term "APRS as ambiguous if we have no standards among the various systems and they only implemented the obvious AVL features...

> >So I agree completely with your conclusion, that this is a 1% of 1%
> >APRS application,
>
> So the problem is...?

Simple:

If Home depot only stocks what 99% of the people want, then by definition, any project that requires 100 parts will always be incomplete because of the 1% missing. Thus, you can never go to one store and get everything that you need for a project. This is shortsightedness in the extreme. And frustrating for the consumer.

One cannot take features and leave them out based on frequency of use. One must also consider importance of use. Take the windshield wipers on a car. One typically only uses them 1% of the time. Hummh.. must be practically useless... How about the trailer hitch? Hummh. Only used 1% of the time. Must not be any need for it.... How about the HAM radio in your car... Hummh. Only 0.005 people in the USA are HAMS. No need for General Motors to design cars with electronic ignition systems that can

withstand Radio Transmissions... shucks, it wont affect 99.5% of the drivers... must not be worth it...

Some of the most important features in some systems are the LEAST used. Take a fire alarm for example...

etc...

But I disagree completely with this assessment. I did then, and I disagree completely with it now. That approach to DF is why no one ever finds a jammer unless the Jammer does the same thing over and over day in and day out obnoxiously and becomes such a nuisance that the talented and prepared DF guys are hunkered down and ready to pounce...

But, unfortunately, that is the status QUO of typical HAM radio, because everyone still thinks of APRS as only an AVL system and does not even know of its omni-dfing power. APRS is not just an AVL system. It is a tool for digital real-time data communications in amateur radio...

Here is how OMNI DFing in APRS(dos) works:

- 1) Not everyone, not even some, but ONLY ONE person needs to have APRS.
- 2) A jammer transmits... Everyone on the repeater instantly switches to REV and notices whether they hear it... This take maybe 10 secs max.
- 3) The jammer only needs to make one transmission. No more.
- 4) At his leisure, the one APRS user can ask for "reports". The voice users say "I'm in Bowie, nothing heard...." or "Im on the north part of the beltway, Nothing heard"... and so on. This takes maybe a minute.
- 5) the one and only one APRS user then simply moves his cursor to each reported area, ADDS an OMNI-DF report to that place on the map for each report and instantly, his APRS(dos) plots the PHG circles drawn inversely proportional to signal strength and instantly the APRS user (and anyone else on 144.39 for tht matter) sees the complete picture.

Then to the most casual observer anyone can see where the jammer both "IS" and "ISNT". And due to the way radio works, 90% of the reports will be showing the 90% of the area where the jammer ISNT. Even if NO ONE hears the jammer, eliminating 90% of the area where he ISNT is very, very valuable...

When I have done this on a FOX hunt, I can usually localize the area of the FOX within the first 10 minutes of an event (by asking for reports on the local repeaters)... I can tell from this approach the general area of the jammer LONG before the DF equipped hounds are anywhere near the area... In fact, when they roll in 1 to 3 hours later, after having driven all over half the state, I could have told them in the first 10 minutes where to go FIRST and then hone their search.

No, OMNI DFing has no chance of finding the guy's house in the "last mile"... But since it can localize the area generally to a neighborhood almost instantly, it is very valuable at localizing the source of interference. Yes, then call in the DF gear to nail him. But most of the time, announcing on the repeater that "the signal appears to be coming from "Tinseltown" will cause the "Tinseltown" jammer to very quickly re-think his strategy...

> Using APRS like this is like pounding nails with a wrench. There is a
> better, much more effective tool (Automatic DF Equipment), and, yes,
> thank goodness, you had the foresight to accommodate that better tool
> as well.

Yes, that stuff works great for ANNOUNCED events and the 2% of HAM radio operators that purchase and use it, but it does practically nothing for come-as-you-are tactical-real-time digital communications of what is happening routinely in one's area. APRS has a MAP. APRS knows what people's radio range is from their PHG. It is ludicrous to me that all APRS applications don't simply tie these two together and apply them to the most routine occurrence and that is locating the source of an interfering signal...

> Is there maybe a message here? My gosh, I'm the only one besides you
> who even supports the on-air protocol for vector DF, a fact that has
> not been lost on the serious RDF fraternity.

Yes, but the RDF community is only 2% of the amateur population and when a signal appears on a repeater that needs to be DF'ed, why not take the data that is already available to everyone and plot it, instead of waiting until you can call up the RDF crew and then wait for the jammer to raise his head "again" later so the RDF folks can do their thing?

HALF of my frustration is that mobile FM hams don't instantly switch to reverse and report what they hear. But the reason they are not in that habit is because they don't know that APRS can use this information to instantly localize the signal. And they don't know that because only APRSdos does it. And these days most people have never seen APRSdos and are using the later programs that have not fully implemented APRS and so.... chicken-egg....

> For those of us who actually know RDF, "omni DF" is a complete
> non-starter. Sorry to burst your bubble this way; don't forget that I
> did at least try to do it "offstage".

Yes, and that attitude towards localizing signals is the problem. "No one can play in the RDF game unless they do it the old-fashioned brute-force gotta-have-the-most-toys" approach... When, actually, the data is available to the other 98% of hamdom all the time.

On a FOX hunt RDF wins hands down.

But during the other 98% of the time in HAM Radiodom when you want to know the source of only a brief unauthorized transmission, you are far better off taking AVAILABLE data from EVERYONE on frequency than waiting a day or so to get an RDF team together and waiting for him to do it again...

Also, remember that APRSdos includes the Civil Air Patrol tried-and-true fade-circle OMNI DFing technique as well. And calling that a "non starter" overlooks decades of practical and successful application of that technique. With it, one person with a mobile radio and APRSdos can drive around and eventually find a signal all by himself.

> I guess if there's one general piece of advice I can offer, it's to
> stop trying to make APRS into "the Swiss army knife of ham radio".
> Swiss knives are great for the infrequent quick fix, but try to do
> anything serious and you'll bust your knuckles.

Ah... APRS !was! designed to be the QUICK FIX of HAM radio. It is supposed to be the "tactical-real-time digital" communications system that lets you communicate quickly and error free (digitally) about anything and everything that is happening LIVE in the local area. I don't know how many ways to say that.... And in that same vein it is NOT supposed to do "serious" long-term, permanent, bulk data, high data rate communications. All of those needs are best done with other systems on a different frequency.

> Let's concentrate on refining what we do sort of well and not heap more
> stuff on a clogged system just because we've managed to fabricate a
> faint connection to another prospective application.

Our difference of opinion is clearly rooted in our differing opinions over what APRS is. And I stand behind the original objectives of what APRS is supposed to be:

"A tactical-real-time digital communications system" for rapid exchange of short bursts of error-free data within an area of local operations.. And limiting definitions of what that data is to only AVL, is a sure way to make sure that APRS remains in most people's minds an AVL only system

with no proactical value beyond that scope..

APRS is NOT an AVL system other than it is nice to know where the mobile stations in your LOCAL network are...

BUT APRS has a MAP, and APRS knows everyone's radio range (PHG) then why in the world not plot "signals heard or not heard" and let everyone SEE where the jammer IS and ISNT. The data is THERE! Why, oh why, not use it?

And Xastir. We can do Omni-DF and vector DF. We don't support
automated DF'ing though. If I had an RDF unit in-hand it'd be
supported.

Unfortunately I'm probably in the "don't actually know RDF"
category. I've done a little, but am not an enthusiast. I can't
judge how well each method might work.

While testing a program I'm writing I noticed 2 messages that do not seem to be within spec:

IRONMT>APRS,RCHFLD,SHEPRD*,qAS,K7UHP:/WB7REL WIDE IRON MT
(This is a position with timestamp - but there is no position)

G10XB>APH104-7,qAS,GORDI:=/4Ri*NH<y-!!A
(This is a position without timestamp - but it looks like Mic-E?)

Is this correct or have I missed something ?

Thanx

Andrew

Neato! Thanks. hard for me to keep up...
Now all we gotta do is get the general ham population to always listen to
the input whenever they want to find an interfering signal and report
their position even if they DONT hear anything...

Bob

So the IRONMNT will never appear on a Map until someone fixes the beacon ?

Sorry for sounding so dim, so both the "compressed format" and the "position
without timestamp" can start with a "=". (and others now I look more
closely)

That being the case, what approach do programmers take to tell them apart ?
It seems there is a variable record type without a unique identifying key ?

>closely)

>

>That being the case, what approach do programmers take to tell them apart ?

>It seems there is a variable record type without a unique identifying key ?

>

This is all detailed in the APRS Spec (page 37).

The compressed format can appear anywhere a normal lat/lon field appears in the spec. A normal Lat/Lon has a digit in the first position, while the compressed report has the symbol table identifier.

Steve K4HG

I think it is a compressed format. But don't have spec in front of me to confirm...

Yes, ANY position can be compressed. The leading TYPE character remains the same. To tell the difference you must always look at the first digit of LATITUDE. If it is numeric it is a normal LAT/LONG. If it is anything else, it is compressed...

I am now involved in a major elmer project and need to know about the capabilities of the version(s) of APRS that work on the above OS's. I am posting here because I'm trying to avoid the "stuff" that happens on the APRS sig. I'm looking for information...not conflict.

This project requires a Unix/Linux APRS client with the ability to do the following:

- o Turn *off* ALTNET function (no matter what is in the to-call, the posit plots)
- o Support both [GR##ID]-in-comment and >GG##ggOI-in-status formats
- o Support for the RFONLY alias. This alias is correctly implemented with the following personality:
RFONLY anywhere in the TOCALL will cause any IGATE to *not* pass the frame to the Internet stream.
- o Easily import custom maps

Secondary Need (but not a deal-killer):

o Ability to ALTNET based on display icon, rather than TOCALL. Something like a BUDLIST/SUPLIST based on icon.

Any input as to title to suggest would be great. Thanks for helping.

Ev, W2EV

Ev,

Forwarding your question to the xastir user's reflector.

I **think** it'll do all you ask. Since it's really the only APRS client being actively developed for **nix*, it's about your only real choice - but what a choice it is!

The Xastir developers would be happy to discuss this with you on the
Xastir lists: The xastir-dev list would be best.

<http://www.xastir.org> will get you the subscription info.

Enough to this sig. It's not really for discussing particular APRS
variants.

I'll send you another note directly that discusses each point you
brought up.

Having read the v1 spec from the TAPR web site I am still currently at a loss on one point 8(.

Chapters 9 and 10 describe the 2 compression methods and how to correctly decode them.

I have coded subroutines which correctly decode the message when passed a string in the correct format for each of the compression types, but now I come to devise the switching mechanism based on message content.

So my question is: "What unique characteristic(s) of a message allows me to

determine what compression method was used"

On the face of it 8 consecutive characters from the sub-set defining base91 encoding would seem to indicate that it's base91 encoded, but as MIC-E also uses a section of the ASCII table (albeit for a fewer number of bytes) there is a potential for overlap. (or am I just being paranoid?)

Thanx

Andrew MOAQM

You need to look at the packet data type. Mic-E packets have a

different type character than standard posits.

All messages in APRS use standard ASCII characters and there is no
compression applied to messages..

I propose the following method for incorporating non ASCII alphabet messages into APRS:

I think we need to establish a NEW message type that is for NON-ENGLISH messages (that cant be spelled with ASCII):

ENGLISH MSGS: :TOCALL :message goes here
OTHER LANGUAGEs: {MJ:TOCALL:message goes here

Notice that the "{" identifies a NEW APRS format
 "M" Means it is a new MESSAGE format
 "J" means it is Japanese (for example)
 ":tocall:" is the same as before (but variable length)
 "message" can use any 8-bit bytes needed...

This then makes it extensible to any alphabets..

Notice that I am suggesting for the NEW TOCALL to be variable length. That will save bytes. The only reason the existing message format had a fixed-length for the TOCALL was historical...

Since all software will IGNORE any NEW "{" format that it does not recognize, this will make it easy to integrate into APRS new alphabets

But this only works for messages. The only other thing is the 20 bytes in the STATUS field, but we should be able to handle them too with a leading special character or something?

Bob

But messages can already contain any 8 bit characters. I understand the desire to make it possible to identify a character set. I recommend using the standard message format so IGates and APRS-IS servers know that these are messages and putting a character sequence after the colon which follows the TOCALL to identify the character set. In most cases, the messaging using characters >= 0x80 is between two stations using the same character set anyway so it wouldn't change their operation at all.

In practice yes - otherwise APRS would never be used in many EU countries - but in theory no. The spec says messages may "contain any printable ASCII characters except |, ~ or {".

In the world outside APRS, "printable ASCII characters" means the characters 0x20 to 0x7F, and I have always assumed that it meant the same in the APRS spec.

Good point. So it sounds like the spec needs to be changed to allow 8 bit characters since they are allowed on AX.25 and in use in other parts of the world.

The exclusion of |, ~, and { is understandable as it keeps common special characters used by TNC's from appearing in the data stream. Same for characters < 0x20 (although Mic-E can use 0x1c & 0x1d).

Although this is an alternative approach, I prefer leaving the existing MESSAGE format untouched so that current applications do not begin to display gyberish. By putting non-European/non-Western FONTS in a totally new format, it avoids any backwards compatibility issues.

I am not sure what software doesn't allow 8 bit characters in the
message. Even if some software doesn't display 8 bit characters,

doesn't even that software display the message converting the 8 bit characters to 7 bit or spaces? I think that is still a better situation than introducing a new format that would have a compatibility issue with IGates and APRS-IS servers. Message packets get special handling for gating purposes. Adding a new message format would make all current IGates and APRS-IS servers incompatible with that format.

Bob proposes a new MESSAGE format for non-european/non-western Fonts
(such as Japanese and Chinese and what-ever...)

> > By putting non-European/non-Western FONTS in a totally
> > new format, it avoids any backwards compatibility issues.

AE5PL says:

> I think [putting 8 bit non ASCII printable characters in the existing
> message format] is still a better situation than introducing a new
> format that would have a compatibility issue with IGates and APRS-IS
> servers. Message packets get special handling for gating purposes.
> Adding a new message format would make all current IGates and APRS-IS
> servers incompatible with that format.

And that is exactly the intent. Bringing in these new completely
incompatible FONTS must be in a *new* non compatible format as well. This
way current IGates ignore the new format completely and do not let it mess
up what we have... Then we upgrade the IGates to "properly" handle the
new non-compatible messages, rather than letting these totally gyberish
fonts munge up the existing APRS system.

By using a new format, we "do-it-right" by introducing a new format for
something that is totally incompatible with past practice and making sure
that it does not mess up what we already have... Yet, we then grow the
system to handle the new format....

There is no way that I want to have GYBERISH messages and bulletins
cluttering up existing MESSAGE lists and traffic pages. If end user
software has the ability to display these graphical fonts, then such end
user software is also easily able to take the new format, convert to the
new FONT and then integrate it into the existing message displays as
desired, but the on-air formats must *not* be intermingled or we destroy
existing systems.

> And that is exactly the intent. Bringing in these new completely
> incompatible FONTS must be in a *new* non compatible format
> as well. This

Now we have gone from character sets to fonts. In either case, there are literally hundreds of these with many different variations. Trying to handle them within APRS will be virtually impossible.

> way current IGates ignore the new format completely and do
> not let it mess
> up what we have... Then we upgrade the IGates to "properly"

What do you mean "properly"? It is an important rule for APRS-IS that NO software on APRS-IS modify packet payloads. That means that local IGates are not to modify payloads in any way when retransmitting them on to RF. If you change the payload, you have now changed the packet, causing many more potential problems.

- > handle the
- > new non-compatible messages, rather than letting these
- > totally gyberish
- > fonts munge up the existing APRS system.

Because you don't understand a language doesn't mean that the message is total gibberish. You are trying to dictate a ban on using 8 bit characters in messages (what about status text and comment text?) to meet your personal preferences.

- > By using a new format, we "do-it-right" by introducing a new
- > format for
- > something that is totally incompatible with past practice and

But past practice has been to go ahead and use 8 bit characters anywhere where text can be used.

- > There is no way that I want to have GYBERISH messages and bulletins
- > cluttering up existing MESSAGE lists and traffic pages. If end user

Then put a switch in your software to not display packets with 8 bit characters.

- > software has the ability to display these graphical fonts,
- > then such end
- > user software is also easily able to take the new format,
- > convert to the
- > new FONT and then integrate it into the existing message displays as
- > desired, but the on-air formats must *not* be intermingled or
- > we destroy
- > existing systems.

Once again, a message is for communication between two stations. A bulletin is for broadcasting to a group something of interest to that group. In both cases, interception by non-involved persons should not be the overriding factor on forcing them to use a format incompatible with APRS-IS. While you can monitor everything that goes on in APRS, it should not be a mandatory factor that you understand everything.

I think we should go the middle way :)

1. The APRS Spec should be updated to support 8-bit characters to fully support Western/European languages. This infact already works fine today in most applications. The spec should also define which characteraset and that should be ISO-8859-1 (Latin 1) or the new updated ISO-8859-15 that is proposed to replace ISO-8859-1. This will support: French, Spanish, Catalan, Basque, Portuguese, Italian, Albanian, Rhaeto-Romanic, Dutch, German, Danish, Swedish, Norwegian, Finnish, Faroese, Icelandic, Irish, Scottish and English. It also support Afrikaans and Swahili.

2. Add Bob's proposal for non ISO-8859-1(15) character sets. This include the mulibyte character sets used in Asia where more than one byte (normally 2) define the character or more correctly (I think) a phonetic part.

[snip]

That reminds me of something I've kept meaning to comment on - Does anyone know where all the trailing spaces on frames in the internet data stream come from? Checking today, only about 10% of the frames have a

trailing space, but other times when I've checked it has been getting on for 20%. Something obviously adds them.

I know that trailing spaces usually won't be significant, and so can be stripped off, but surely it is avoidable corruption?

Take a look at the packets. I haven't, but I would venture to guess that users have put the trailing spaces in the packets (at the end of a comment, message, etc.). I am not aware of any software that adds trailing spaces. Doesn't mean it doesn't exist, just that I am not aware of any software that does this.

javAPRSSrvr does not strip off the trailing space because, as you say, "trailing spaces usually won't be significant". The key word here is "usually". It is my firm belief that server software leave the payloads completely untouched.

The corruption occurs when TNC's and other software arbitrarily strip trailing spaces off of a packet. javAPRSSrvr does account for this in the dupe check algorithm, but leaves the payload alone.

Good question :)

I guess I was sloppy with the terms FONTS and CHARACTER SETS... I am
talking about character sets. Sorry...

I am confused by what you are talking about here. Nothing that I am

talking about has anything to do with "modifying payloads".

> > handle the new non-compatible messages, rather than letting these

(I meant character sets)...

> Because you don't understand a language doesn't mean that the message is

Nothing personal here at all. And you are misunderstanding the approach. Let me explain what I mean by gyberish. I don't mind at all seeing German, Italian, Greek, Spanish or any other message that uses only a difference in FONTS. That is just fine with me. What I don't want to see in the current message format are 8 bit gyberish that includes form feeds, line feeds and generates hyroglyphics all over the screen that mess up current systems, and are unreadable by someone even if he was conversant in that language.

> > By using a new format, we "do-it-right" by introducing a new

I Fully agree, as long as it does not contain control characters that produce garbled results in standard ASCII.

> > There is no way that I want to have GYBERISH messages and bulletins

Impossible. I can put a switch in what goes into code from this day forward, but I cannot change how things are displayed on thousands of copies currently in use and or how it is displayed on a Kenwood...

That is why it is a NEW proposal, to accomodate a NEW requirement. That is, the transmission of the three character sets of Japanese for example. When it is adopted as a NEW system for the end users, then the NEW format will be incorporated into NEW APRS-IS code as well... All of this without messing up the displays on what exists now and in the transistion...

> While you can monitor everything that goes on in APRS, it
> should not be a mandatory factor that you understand everything.

We agree 100%. But ANYTHING that is monitored must not damage older displays. That is my approach here. I have no objections to stuffing new stuff in old formats as long as it does not break existing APRS. If it breaks something old, then it must use a NEW format that can be accomodated into NEW software so that it can be FORWARD compatbile without being BACKWARD DAMAGING...

Oh by the way, this whole argument may become mute as I think I have just learned that the Japanese JASCII is 7 bit ASCII compatible and may not be a problem... THus it can go in existing message formats... which I hope is the case (as do you)... then we dont need a new format...

Bob

Yes, that is what I meant although I did not do as good of a job at explaining it as you did...

Thanks

Bob

In message <LYR26815-96041-2002.08.28-10.10.56--roger#peaksys.co.uk@lists.tappr.org>, AE5PL Lists <HamLists@ametx.com> writes
[snip]

>
>Take a look at the packets. I haven't, but I would venture to guess
>that users have put the trailing spaces in the packets (at the end of a
>comment, message, etc.).

I ain't that stoopid! ;-)

When I first noticed it, I had a good look at the packets. In particular I looked at -

- (a) Frames from Ultimeter wx stations.
- (b) UI-View beacon frames with the UI-View "tag" on the end.

Because spaces on either of those are quite definitely not added by the user.

Also, I've used three different telnet clients to collect data, and connected to several different servers, to try and make sure that the problem really exists, and isn't being caused by my test system.

If you collect a dump and run a filter on it outputting frames with a space at the end, you will find things like (sorry about the wrap) -

HB9IBI-1>APU24L,HB9IAC-4*,WIDE,qAS,HB9DQU-10:=4611.75N/00612.43EInternet Gateway {UIV32}

EA5AWF>aprdsMUEA,TRACE7-7,qAS:=3749.18N/00053.32W-Manolo,Box 26,San Javier c.p.30730 (MU) {UIV23}

W8MAP-1>APRS,W8MAP-4,W8APR*,qAS,w8gps:!!004500C70272009926F5030003A8----00EF0261000000059

W8MAP-1>APRS,W8MAP-4,W8APR*,qAS,w8gps:!!006400B80273009926F4030003A5-----
00EF026600000059

A little analysis showed -

(a) If there was a space at the end of one frame from a station, it was likely there would be a space at the end of all frames from that station. (See the two frames from W8MAP-1 - both have two spaces on the end.)

(b) There were some clusters of stations that always had spaces on the end of their frames. For example, at the time I looked at it, there were a group of 'SV' stations. However, there weren't any 'G' stations, suggesting that it wasn't being caused by UI-View IGATEs, which was the main thing I wanted to check at the time.

It seems likely that it is caused by a particular type of IGATE or internet server, probably only in certain circumstances. The spaces aren't in the packets before they go onto the internet, I've managed to check that out with one or two stations.

But German, Italian, Greek, and Spanish use characters that are not in the 7-bit ASCII family. Form feeds, line feeds, and other control characters are all less than 0x20 (hex 20). So, a character with the most significant bit set does not generate these. However, if your

application is improperly stripping the most significant bit from the payload data, I can see how your application would not handle any 8 bit data correctly, regardless of packet type.

Ah, but are they added by the programs generating those packets? That is a possibility too.

I think, from your statements, that the software generating the packets needs to be looked at as well as IGate and server software. It is possible that a TNC setting might be adding white space or an IGate might be adding it. I can assure you that javAPRSSrvr is not adding the white space. javAPRSSrvr does ensure that every line is terminated with a CR/LF sequence. It may be that some software only handles CR or LF but not both. However, it is important due to many operating system differences that all APRS-IS software be able to handle both.

I can't speak for aprsD or AHub. It has been my experience, however, that AHub strips any trailing spaces from the payloads. Any chance of identifying some of the IGates using the q construct? Might help to identify what software they are running.

We have a problem with double byte characters anyway. Due to the assumption that data is received and transmitted via command mode on a TNC, there can't be any double byte characters allowed where one of the bytes is a control character. This is true regardless of packet type. For instance, APRS-IS assumes that all packets are terminated with a CR or LF (or both). If a double byte sequence with one of these characters occurred in the packet, you can see that packet would be lost/mangled. I think we need to specify, because of the above assumptions, that double byte character sets cannot be used.

For clarification. The ASCII table define printable characters as Pete say
from 0x20-0x7f. ISO 8859 define printable characters from 0xA0-0xFF so it
are these we actually are talking about to allow in the payload.

That point was answered in the last paragraph of my previous message
said -

"The spaces aren't in the packets before they go onto the internet, I've
managed to check that out with one or two stations."

> It is

>possible that a TNC setting might be adding white space or an IGate
>might be adding it.

IGATE - definitely yes. (I mentioned that possibility). TNC? Well, I've
used "normal" packet for 20 years, and used just about every type of TNC
going, and I've never seen a problem with added white space.

>I can't speak for aprsD or AHub. It has been my experience, however,
>that AHub strips any trailing spaces from the payloads. Any chance of
>identifying some of the IGates using the q construct? Might help to
>identify what software they are running.

As I said, run a filter outputting packets with a space on the end, and
you'll soon collect yourself a big dump. If you don't I'll be really
interested in why I see the spaces and you don't!

It is the double-byte Japanese that is exactly why I brought this whole thing up in the first place (though I must not have done a good job of explaining it).... And that is why I initiall thought we will probably need a new format to handle such character sets and that it should not be stuffed into existing MESSAGE format.

It was this initial concern that caused me to suggewst that we might need a new format to isolate these frames from our existing code.

But I have since learned that the double byte Japanse charcaters that triggered the initial concern do also use only printable 8 bit bytes and so my concerns for control-code problems is probably not a problem.. Here is what I hve learned since my original sugestion:

Each Kanji code use 2 bytes.
The 1st byte is 0x81-0xFC.
The 2nd byte is 0x40-0xFC.

These are all printable ascii codes and therefore do not include any control codes and so therefore I think can be safely used within the existing APRS message format.

End of drill unless there are other character sets that will try to use control codes...

Bob

Bob,

Haven't worked with UniCode, so I don't have a clue. Will the kanji coded characters cause a problem with Packet lengths, or field lengths?

What will be the effect on code that looks for Message To call, and object name fields to be nine bytes in length?

Will total packet length increase appreciably? Note that some applications will reject any packet that is over 250 bytes in length.

I think the first step in any processing would have to be to take the pairs of bytes from the AX25 frame and convert them into whatever double byte character set (DBCS) was being used, then measure field lengths in characters, not bytes, after you'd done that. Presumably Japanese TNC firmware handles the packing/unpacking?

>Will total packet length increase appreciably? Note that some applications
>will reject any packet that is over 250 bytes in length.

There would still be a restriction of 256 bytes on information field length, because that is part of the AX25 spec. (Unless we're talking internet only.)

I think we really need someone who is experienced with Japanese software

to comment on this.

My only concern was that single byte character sets recognize the hard display limits in APRSdos of 67 bytes (64 in the Kenwood D700) and 45 in the D7... If it takes 134 double bytes to convey 67 KANJI characters then that is all right with me. BUT, since a KANJI character conveys more meaning per character, they dont need nearly as many for the same

amount of message, so it really doesnt matter especially since APRSdos and the Kenwoods are not going to display them anyway.

So I think that sticking to the 67 byte limit will not be too restrictive. Ill check with the Japanese...

I think you hit the nail on the head. Within the limits of AX.25 (256 byte Information fields), as long as control codes are not part of the character set, all is well (true, some systems impose further barriers to packet length such as the Kenwood radios and some software). For people using DBCS in their messages, they need to be aware of the APRS length restrictions apply total number of bytes, not characters. That would be something for the authors of software using those character sets to think about.

Glad this got sorted out. I want to see, like you, APRS used in as many different environments as possible. The limitation of no control codes, |, ~, or { in messages is a good one that should be observed in all packets to maintain as much compatibility as possible.

On to the next problem :) By the way, because of this discussion, I am updating javAPRS to display all comments and messages in the default character set of the system it is running on. Should help those international web pages.

Really? I would have thought that all the *APRS* length restrictions, as
opposed to the AX25 restrictions of 256 bytes in a frame information

field, seven bytes to an address, etc, apply to characters. Particularly since all those little diagrams in the APRS spec have comments like "max 67 chars".

> Or go directly to UTF-8 so you do not need to specify which codepage
> is used.

Good point. The UTF-8 encoding of Unicode will add an little extra load

since each non ASCII character will be coded in ≥ 2 bytes. I don't know how well Unicode is supported on the various platform we use, in particular Palm and PocketPC. ISO 8859 is for sure available. One thing is for sure it is not supported on Kenwood, 8859 isn't either only part of it and D7 and D700 are not consistent.

I would like to see a message format that uses an Unicode (<http://www.unicode.org/>) message body. For those not familiar with Unicode, it is 16 bit (2-byte) per character. Java natively supports (uses?) Unicode. Plain ASCII is easy to encode, and if all you want is to display plain ASCII then that is easy to.

Unicode can be sent over 8-bit links using UTF-8 encoding. This solves all of the problems with existing TNC compatability.

Here is what I propose:

- 1) everything besides the message body be plain 8-bit ASCII
- 2) message identifier be a | (pipe), or any other single character that has not yet been used
- 3) 9 byte addressee, identical limitations to current addressee field
- 4) address / body seperator be the same as the message identifier
- 5) variable length, up to 240 bytes. Each unicode character is ≥ 1 && ≤ 4 bytes
- 6) body / sequence number seperator, same as the message identifier
- 7) 2 byte ASCII sequence designator

Sample message:

KB0THN>APRS:|KB0VY0-10|UTF-8 encoded unicode message|ab

comments?

-Jim KB0THN

PS - one way or another, I'll be happy to add support to aprsworld whatever this group decides.

Final comment before I go into read-only mode for this thread - If I was you, I would wait until you know what encoding/decoding a Japanese TNC does.

UTF-8 is 8 bit only. It is a subset of Unicode without the DBCS support.

I think this is still debatable to some degree and open for discussion. The 67 character limit imposed in the spec is the DISPLAY length, not necessarily the BYTE length (or at least that was the origin and intent of the restriction)... If it takes two bytes to make up a character, then that only counts as ONE, as far as the size of the display is concerned. So I would always call it a display limit, and not a BYTE limit...

As has been pointed out by Bob earlier, the need for a special format is not required. However, full Unicode is not compatible with APRS because some of its bytes are less than 0x20 (control characters). Unfortunately, there is no way to tell a TNC in command mode "ignore these characters because they are Unicode". So, to live within the confines of our current limitations on APRS and APRS-IS, it makes sense to say "any byte 0x20-0xff excluding |, ~, and {". The final exclusions are because many TNC's interpret those characters as commands.

Fine with me as long as they stay within the AX.25 spec which specifies 256 octets (bytes) maximum for a packet's information field. Don't know how other APRS software would handle the extended packet lengths.? I would also say that, if IGating is to be taken into consideration, then the third-party format restricts the total payload length to 256-28 bytes or 228 bytes (I think I did my math right :)

Actually, if you have 8-bit clean links, you can send Unicode directly.
UTF-8 does something different.

Unfortunately, although AX-25 should allow it fine, the current implementations are anything but 8-bit clean. I suspect that you could crash and otherwise harm 90% of APRS stations by sending 8-bit characters. I would be the first to applaud a move to 8-bit clean links, as I've seen plenty of problems with the current "sort of 7-bit" system that is in use - but I don't see a way of upgrading the existing hardware. And one of the reasons APRS is so popular is it is a fairly cheap thing to get involved in. Unfortunately that also means that we sacrifice some principles in the process.

UTF-8 is designed to be interoperable with ASCII directly. IE normal ASCII characters are encoded as a single byte.

In our application UTF-8 will make sure that no printable and bellow characters will be changed. Only things with the high bit set will be able to contain Unicode.

On Wed, 28 Aug 2002, Roger Barker wrote:

> I think we really need someone who is experienced with Japanese software
> to comment on this.

I got the answers...

Kanji is a two-byte printable ascii code and it involves a 3 byte ESC-IN
and an ESC-OUT code so it can be intermingled with plain ASCII... So even
if they took the 67 display limit as a character limit, that still allows
30 KANJI characters..

And as an aside, a common school test in Japan is to have them say
ANYTHING in 20 KANJI characters or less...

So for now, this issue is resolved to my satisfaction... thanks

Bob

There are three different encodings in common use for Japanese. It sounds like you are describing Shift-JIS (most common in the Microsoft world; I believe the 1st byte is actually between 0x81-0x9f or 0xe0-0xef... so as has been pointed out, the path needs to be 8-bit clean or they start looking like control codes).

EUC-JP (most common in the Unix world) is beloved by programmers since both bytes are in the 0xa1~0xfe range.

ISO-2022-JP fits in 7-bits with escapes to switch sets.

<http://web.lfw.org/text/jp.html> is a quick reference to Japanese encoding.

73, Jim 7J1AJH/AI8A Tokyo

Can anyone please tell me what the "qAS" field means in the following frame
obtained from an internet APRSserver? It is typical of many such frames.

I have written the Sprouls to ask for their help (or any work previously done) for the shelters list. After about a month and no response, I have come up with a few things.

Goals:

- 1.I want to develop a method which is interoperable across APRS and PSK31.
- 2.A shelter list is simply a collection of data. Alpha and numeric characters to be filled in on a form.
- 3.The forms are already in use. Every agency uses different forms, so we need a way to specify a particular form and numbered fields
- 4.All data needs to be human readable - ie compatible with PSK31's character set.
- 5.Data needs to have the ability to be fragmented into small (80byte or is it 67 byte?) chunks and reassembled on the other end.
- 6.PSK data needs a checksum. I suggest the plaintext hexadecimal XOR system used in NMEA data.

Protocol:

Data will be modeled after GPS telemetry. \$SL will indicate this is a Shelter List message. Comma delimited fields. There should

be a header which indicates this is a shelter list formatted message. After the header is the agency's form number. Next will come a numeric field indicating the field on the form, then a comma, then the alpha or numeric characters for the contents of that field. These fields will continue repeating until the maximum length for an APRS formatted message is reached. In the case of PSK31 formatted data, the "*" character will be appended followed by a NMEA compatible checksum.

In the event all fields do not fit in a single aprs message, additional aprs messages can be sent following the same format. The only difference will be that different field numbers will be used.

Note that the fields on the form do not need to be transmitted in any order at all.

There is no need to define the number of fields on a form. The recipient of the message will know this since he will be filling out the form initially by hand (later with a template in a version of APRS) and will know when he has received all fields.

Example:

Form "TEST1"

The _____ jumped over the _____. Maximum population for the _____ shelter is _____. Present population is _____.

First, we have to number all the fields.

Form "TEST1"

The __1__ jumped over the __2__ . Maximum population for the __3__ shelter is __4__ . Present population is __5__.

Since a template is stored at the receiving end, we only need to send an APRS bulletin.

```
$SL,TEST1,1,cow,2,moon,3,Charleston SC,4,500,5,103
```

This is decoded on the other end by simply matching fields...

the form is of course, TEST1.txt

The __cow__ jumped over the __moon__ . Maximum population for the __Charleston SC__ shelter is __500__ . Present population is __103__.

Of course,

```
$SL,TEST1,5,103,1,cow,4,500,3,Charleston SC,2,moon
```

has the same meaning.

What do you think?

I'm going to add one thing to the spec.... we need to include a time and date stamp.... the standard APRS formatted 4digit time with 2 digit date will do fine. This additional field will permit easier matching on the receiving end when, for example, a copy of a form is sent out once an hour. This will permit trending on the RX end by stuffing the data into an array (or database) in an orderly fashion indexed by date/time.

\$SL,TEST1,1,cow,2,moon,3,Charleston SC,4,500,5,103

becomes

\$SL,081423z,TEST1,1,cow,2,moon,3,Charleston SC,4,500,5,103

or

\$SL,081023/,TEST1,1,cow,2,moon,3,Charleston SC,4,500,5,103

On the receiving end:

At this point what we need is to have a standardized template format. I would like to suggest seeding a text file with "&&x&&" where "&&" is an escape character unlikely to occur in day to day text, and "x" is the field number. Of course the file name is the form name. For a form named "TEST1" there is a file named "TEST1.TXT" at every EOC.

Text file named TEST1.TXT

The &&1&& jumped over the &&2&&. Maximum population for the &&3&& shelter is &&4&&. Present population is &&5&&.

Wes

Instead of adding a new meaning to the \$ data type, why not use the

user-defined data type of { ? Throwing in a new meaning to the \$ data type might break some APRS software. The user-defined data type would be perfect for this application as you could have special software look for these packets without potentially breaking other software. Try {SL for User ID=S (Shelter) and Type=L (List)

For historical interest, here is a file I have dated 9/1997:

Position

@POS,date,utc time,lat,long,power,gain,height,symbol,text
@POS,970627,2103,3401.234,-11720.345,,,A1,KH2Z %Alert
note that power, gain and height are null

Fixed station Position (date and time = null)

@POS,,,3401.234,-11720.345,100,8,75,A1,High Mountain Digipeater Covering all
of So.Cal.

Alternate Position for moving stations

@TRK,date,time,lat,long,speed,direction,altitude,symbol,text

Message

@MSG,date, utc time,Lat,Long,TO,msg number,symbol,text
@MSG,970627,2103,KH2Z,1,,%Hello world. This is just "brain storm'in"
Short Message with Date and Time null.
@MSG,,,KH2Z,1,A1,%Hello world

Weather

@WX,date,utc time,lat,long,wind speed, direction,gusts,tempurature,rain
fall,precipitation,P,humidity,barometric pressure,symbol,text
@WX,06291845,3401.234,-11720.45,0,0,10,80,0,0,0,38,1012,A9,Davis

(_06291845c000s000g000t000r000p000P000h00b000000Davis)

Short Weather

@WX,06291845,3401.23,-11720.345,8,276,,76
Missing fields are concidered null.

Object

@OBJ,date,utc time,lat,long,speed,direction,obj name,symbol,text
@OBJ,970627,2103,3401.234,-11720.23445,20,330,Andrew,A4,Peak Winds 160 mph

@OBJ,,,3401.234,-11720.234,,,Race Start,Z3,So Cal Marathon

Telemetry

@TEL,date,time,lat,long,number of

fields,field1,field2,field3,...,fieldN,text

@TEL,970628,1311,3401.23,-11720.23,4,35,-24,17,245,Remote Thrust Fault

Seismic Monitor

Map Object

@MO,count,number,Lat,Long,Name,Scale,X1,Y1,X2,Y2,X3,Y3,,,,,,,,,

Count would be number of sentences in complete record

Number would be which sentence number this is in total record.

Query

@Q,Type,Lat,Long,Range,Call,text

?APRS?

@Q,POS,,,,,

Directed ?APRS? (WB4APR ?APRS?

@Q,POS,,,,WB4APR

Range ?APRS? lat long range

@Q,POS,,lat,long,range,,,

Query Status

@Q,Status,,,,,

@Q,Status,,,,WB4APR,

Query Weather

@Q,WX,,,,WB4ARR,

Query Destination

@Q,Dest,,,,WB4APR,

Query Protocol Format - Returns format of POS sentence

@Q,Protocol,,,,WB4APR,POS

Reply

@R,type,utc date,utc time,lat,long,symbol,text

Respond to a @Q (?APRS?)

@R,POS,,,3401.234,-11720.234,,,

Direction Finding

@DF,date,utc time,lat,long,bearing,sig quality,text

@DF,,,3401.345,-11720.23,273,7,

Warning/Alarms/Alert Maybe this is really an object...

@W,date,utc time,lat,long,call,type,text

@W,970627,2127,,,,Road,%Warning Bridge under water!

An alert with lat/long would specify the location of an alarm situation.

No position data would be a general alarm.

Would this data type {SL be entered in the text part of an aprs message? The reason I ask is that I'd like this to be implemented relatively quickly and since all versions of aprs have a way to enter messages.....implementation time is 0.

Wes

No. This has nothing to do with messaging. You can do anything you want with message text. This has to do with packet data types. My understanding was that you were trying to use the \$ data type for this application. If you are using \$SL in the message, then have at it. But, if you are trying to use the \$ as a data type for the packets, I recommend using the { data type since that is what the user-defined data type is meant to be used for, not the \$ data type.

I see... well until the authors include this as a message type (wouldn't it be cool to have the form displayed with the blanks ready to be filled in by tabbing between fields?) in your favorite aprs program, I don't see any reason not to use your suggestion of {SL as the identifier for a shelter list formatted message.

Thanks for your input!! I'm off and running!
Wes

I agree. But actually, there is already a SHELTERS data identifier, and since in the past 6 years, no one has used it, I would think it would be OK to define it. Go back and look at the original APRS paper in 1992 and identifying the RESOURCES at every station was actually one of the more important parts of APRS back then...

Since I am basically lazy and don't want to spend my afternoon trying to find this paper you talk about, how about telling us what is a "shelters" data type, what is its format, and why it never made it to

the spec.

Thanks.

The data type is a "+" and that is all that has been defined. The
Sprouls were going to do it. So I abandoned what I had begun...

My idea was the first letter is the +,
The second letter is a TABLE character that defines what "table" is
represented by the remaining data in the line.
Then the remaining data is a series of fields representing what is on that
table.

One table might be the list of RESOURCES at a shelter
another might be the FREQS and BANDS of operation,
another might be the materials at the medical tent.
etc...

Ok, I found it in the spec... just one reference... "the + character reserved as shelters list." Doesn't matter to me... {SL or +SL
... let's just settle on something. The sprouls asked for beta testers over a year ago and I volunteered, never heard a word back from them. Let's get this thing rolling. Red Cross and hospitals here are asking for this like crazy b/c 9/11 and hurricane season.

Wes

OK, lets do it. If I can summarize what you proposed:

SHELTER FORMAT: +FORM,N1,D1,N2,D2,Nn,Dn...

Where:

"+" is the SHELTER FORMAT INDICATOR (APRS Type character)
"FORM" is a variable length FILENAME (with assumed extension .FRM
"N1,D1" are ordered pairs of numbers with the first being the

Nth FIELD and the second being a STRING value for that field.
LENGTH. There is a maximum packet length of bytes of 128 bytes
starting with the "+" byte.

Thats it. Only question is whether we agree witht the .FRM file
extension. Wes proposed a .TXT extension, but there are just so many .TXT
files in our systems, I would prefer a unique recognizable extension
that makes it easy to find these "forms". But does this raise issues with
Bill-Gate's TEXT EDITORS that these days have to have a .TXT extensino to
work? Doesnt bother me, since I still just use EDIT.COM for mos of my
editing with aoccassional use of WORDPAD if I have to use a Winders
machine...

Bob

.FRM files are also used in Visual Studio to indicate form files, as well as a number of other software packages. FRM is a fairly "controversial" extension, as many pieces of software want to register to it. Maybe AFR for APRS Form or something similar? If you're going to do file extensions, pick a one-character prefix and then choose a meaningful 2-character suffix. You can then associate those extensions with Notepad, and not have to worry (probably) about colliding with other programs.

Extension? Why does the file need an extension? I have spent any appreciable time with DOS, so I don't know. If you do need an extension, don't make it assumed to be anything. Put the whole filename in the message.

I think TXT is just fine. But, the "+" packet construct is not ideal. The APRS-IS does not understand it. I would propose an extension to the Message format:

KH2Z>APRS,WIDE::WB4APR :F:FormName,field1,field2,field3,...{MM}AA

We should allow for messages greater than 67 characters.

Brent KH2Z

Brent made a suggestion to me off line this morning....
SHELTER FORMAT: +FORM,DDHHMM[/|z],D1,D2,Dn...
To which I suggested
SHELTER FORMAT: +FORM,DDHHMM[/|z]Nx,D,D,D...

This allows for easy indexing of forms which must be spread over multiple

packets. I feel it is very important to be able to chain packets together if there is more information than will fit in one packet. Brent's complaint was that the n1,d1,n2,d2 format was redundant. Also, let's not forget the TIME and DATE so we can keep shelter lists sent at different times indexed.

Can we get space on TAPR for these forms?

Wes

APRS-IS will pass the + packets from RF to the Internet. However, there will be no special handling for those packets as there is for messages (gating back to RF more difficult). However, this might be ok as this information is really only for local area use anyway (at least that is my understanding). Also, there is no acking so these packets might get collided with. Again, this might be well within what is desired.

I agree that if the desire is to use this format for messaging, then the message data type should be used and the format of the message should be "agreed upon" similar to the NTS message format.

Bob, thanks for pointing out the + data type. Definitely a good one for showing resources in a unicast environment.

Here's another issue.. we are using the comma to separate fields. That is the standard for NMEA data and other types as well... however, some names such as CHARLESTON, SC and some numbers such as \$9,999.99 have commas in them. I'd like to propose we copy what CSV files do. If you have a field which has a comma in it, we need to surround that field with double quotes.

CHARLESTON, SC = "CHARLESTON, SC"
\$9,999.99 = "\$9,999.99"

When a user enters a message, if he uses the double quote character, we need to strip it out.

Wes

OOPS, We need to add a SERIAL number so that we konw WHICH particular copy of a given form we are dealing with. For example, My form is number 123456, and any UPDATES to that form will always include that serial number.

Yes, that is possible, but my thoughts are...

- 1) I don't like TXT, because I want to be able to say sort a directory by extension and be able to quickly be able to identify all the files of the type for our FORMS and be able to manage them with wildcards. Making them .TXT files gets them lost among all the other bazillions of other TXT files...
- 2) The APRS-IS is compatible with the + type construct, because the APRS-IS is supposed to be transparent to all packets. It should inject a "+" type character without any modification.
- 3) No need to have the message overhead and limitations to apply to this new construct especially since we have had the + field reserved for shelters all along...

Bob

Agree completely with the addition of the DATE/TIME (and a SERIAL number as I noted before).

> Brent's complaint
> was that the n1,d1,n2,d2 format was redundant.

Not at all. Most forms are very sparse and most times you only fill in a small number of fields. Also later you will want to send UPDATES to various fields on the forms. It is better to send the field number and then the data in order to keep the overall packet size smaller.

Of course this all depends on assumptions:

- 1) Forms are usually sparse and not all fields are usually used
- 2) Frequently only a few numbers on a form change and those need to be updated efficiently.

If these assumptions are not correct, then I agree that numbering every field adds overhead, but I think the assumptions are more correct than not...

> Also, let's not forget the
> TIME and DATE so we can keep shelter lists sent at different times indexed.

The serial number is for indexing... Not the date/time stamp. Thus only the serial number is unique. If a new packet contains a matching serial number, then it is "replacement" data and the new date/time of the form is the date/time of the most recent update.

- 1) TXT - you could of course create a directory for forms.
- 2) APRS-IS transparency. That is not what I'm talking about. The "+" construct as defined, is not a directed packet. A Message packet is only directed packet that traverses the APRS-IS, RF>Internet>RF or Internet>RF.
- 3) Using messages does add overhead, but that overhead is used to help (help) insure packet delivery. And group names can be used if desired.

Brent

Suffice it to say that each agency involved already has a way of numbering their forms and their revision levels. When we move in to help them, we need to make sure we are as "transparent" as possible. I know that DOS restricts us to 8.3 filenames, but windows, linux and mac do not. I don't care much for 8.3 naming of forms b/c some agencies may have a form name which is longer than that (esp when you start adding revision levels). Since these lists will be sent locally, and we try to make all offices of an agency interoperatable, one could assume that either 1) every PC in every shelter would run the same version of aprs software (everyone either uses >8 file names or not), 2) that issues of naming a file so that the lowest common denominator would work would be handled locally, and have no place in the spec. I know someone has to set a limit b/c so many languages require declaration of variables, but it shouldn't be 8 characters. How about 32?

No disrespect indended, but would it be possible to generate a table in APRS dos to cross reference the possible long file name to an 8.3 name?

Wes

In respect to APRS, forms need to be short. Sparse forms just require a blank field in the proper count.

I am sorry, but I did not see the original request...

I will be more than happy to give you the previous work on this and help..

The best starting place is to talk on the phone..

Please PLEASE PLEASE do not make it starting with \$SL, i.e. no \$ at ALL!!!

This would screw up the protocol all together.. I will share with
you what was done....

Keith Sproul

At 22:15 -0400 9/7/02, Wes Johnston wrote:
I have written the Sprouls to ask for their help (or any work
previously done) for the shelters list. After about a month and no
response, I have come up with a few things.

Goals:

1.I want to develop a method which is interoperable across APRS and PSK31.

- 2.A shelter list is simply a collection of data. Alpha and numeric characters to be filled in on a form.
- 3.The forms are already in use. Every agency uses different forms, so we need a way to specify a particular form and numbered fields
- 4.All data needs to be human readable - ie compatible with PSK31's character set.
- 5.Data needs to have the ability to be fragmented into small (80byte or is it 67 byte?) chunks and reassembled on the other end.
- 6.PSK data needs a checksum. I suggest the plaintext hexadecimal XOR system used in NMEA data.

Today, we have addressed

- 1) Quotes around text that may contain commas
- 2) date
- 3) serial number (should we use the "{" at the end of packet just like message protocol?)
- 4) file name length and file extension (are the votes in yet?)
- 5) should "shelters" be a subset of message format or it's own data type. (votes?)
- 6) Field name and Field data structure.

As far as the basic field name/field data format, I see two camps...
Bob wants to specify n1,d1,n2,d2,n3,d3....
Brent wants to speicfy d,d,d,d,d,d

Here's a compromise...

Any field starting with a "&" is considered to be a field name. Other than that, you just specify the first field name, and data fields in sequence until you need to skip a field. At that point have a field with &x (where x is the field number/name), and continue on with data in sequence from there. Note that this does not preclude using the & character in any part of any text that may be in a field, only in the *first* position.

+FORM.EXT,DDHHMM[/|z],{&n1,{d1,n2,d3.....,&Nx,dx,dx+1,dx+2{<serialnumber>

Consider these two examples....

+form.txt,091447/,<data1>,<data2>,<data3>, ,<data5>,<data6> ,{001

note the missing field-----^

or

+form.txt,091447/,&<field1>,<data1>,<data2>,<data3>,&<field5>,<data5>,<data6>
>{001

Does this satisfy both camps?

Wes

Agree to all, but although we are talking about "forms" and we can all envision a bunch of red-cross forms of various descriptions and these in general probably need to go to one place, that is not what I think of when I think of the "general shelters concept" that we are trying to implement in APRS.

The original concept of "shelters" was just a buzz word to describe the ability to transmit to the NET, the presence of resources of all kinds at any given location. This was good data to have and display at all stations. Two examples are:

SHELTER: Beds, people, casualties, meals, workers, VIPS's, blankets, etc
STATION: VHF, UHF, HF, Bands, ATV, SSTV, APRS, Internet, Phone, E-power

So in this discussion, I am not thinking in terms of directed data, but

data that is displayed at all stations for everyone showing the capabilities and resources at that location...

Hope that helps.

Wes's idea of using "forms" as a way to give us an almost infinite variety of reporting formats is just an expansion of my original APRS concept where I was using a single character (1 of 92) different pre-defined formats. But the Forms idea makes it generic and alterable in the field... I like it...

About the .TXT extension. Even if it is placed in an "APRS\FORMS" directory, these files are going to be exchanged individually over and over and almost re-created and re-defined on the fly and in the field. In this case, people are going to be sending these files named "XXXXX.TXT" independently of the application. Thus when I see an attachment or get a disk with some .TXT files and see R-CROSS.TXT file, sooner or later I am going to forget that that is a FORMS file.

I just dont like making life harder than it already is. If it is a special file with a special application, then I dont see the harm in calling it a FORM file. Since someone said that FRM is already in use, then lets go with the suggested AFF for APRS-FORM-FILE. Then when I see a "AFF" file, I will konw what it is without having to open it and look at it...

Bob

I strongly disagree. Just because someone names a FORM as
"RED_CROSS-VOLUNTEER_BACKGROUND-DATA_FORM" is certainly no reason for us
to be so wasteful in bandwidth when all we are trying to do is identify
the format of that form. And since such a file name is meaningless
unless the form is available on both ends of a COMM link, then, there
is little requirement for detailed human readability. Just make sure that
both ends of the link have the RCVBDF1.AFF file and be done with it.
And this way every single packet dealing with that form only has to have
the letters "RCVBDF1" in it and not the 32 bytes of verbose chatter...

An 8 byte file name can represent over 4,000,000,000,000 different files.
Should be enough...

Bob

Steve McCarter also notes that you have to have the former since:

I think that is getting close. Because except for the multi-packet
problem, I think most forms will probably be more than 50% full, so then
leaving out the FIELD NUMBER will save data. But you do have to have the
STARTING field for the sake of multi-packet extensions. So I suggest:

+FORM.,DDHHMM,S#,N#,D,D,D,D,D,,,,,

Where S is the serial number, N is the STARTING data field and D is all values after.... where FORM is up to an 8 byte file name with the assumed extension of .AFF. DDHHMM is the time stamp for this particular data update. Length is limited to 128 data bytes starting with the "+".

> updated efficiently.
>

Also, consider the issue of a form that has more filled out fields than can be fit into a single packet. This will require fragmenting the form field listing over at least two packets, so field numbering is important to knowing *which* field the value belongs to!

Present format: :
+FORM.EXT,DDHHMM[z|/],S#,N#,D,D,D,D,D,,,,,.....

I still don't see how the date/time stamp isn't a serial number... it
does repeat after 30 days though... but then so would a serial number
each time the power failed and you had to restart your PC.

What about a heirachy for indexing based soley on FROMCALL -> FORM name->
DATE/TIME ? In other words, I should be able to hook (or double click) on a
station and pull up a text page with a listing of all shelter reports, click
on a report and see each date and time that form was used. Clicking on each
date/time should show a completed form with the blanks filled out.

If the serial number makes indexing in program memory or on disk easier, and
you are willing to have a few extra characters in a file, ok then.

Is there a top limit for serial number before it cycles back to 0?

When a packet is fragmented, do each of the fragments have the same serial
number for collation? Or is each fragment uniquely numbered? I was
thinking that the fragments would be collated by date/time stamp.

Am I being thick?

Wes

Ahhhh.... I hadn't considered a forms for each victim at site.... Serial number it is...

Was that the last hurdle? (me feeling very good)

Wes

```

Serial number identifies each use of the form. If each person at a shelter has a VICTIM-DATA-FORM to fill out, and there are 400 people, then you need 400 serial numbers to identify each use of said form...

The time stamp has nothing to do with the data on the form. It simply identifies for this packet and this particular instance for this form (VICTIM number 347 for example) the date/time that this packet was sent. The presumption is that if you sent this packet, you also updated anything else on the form that has changed as well. Thus this date/time stamp represents when this particular instance of this particular form was last updated.

No two packets will ever have the same date/time stamp so they cannot be used for indexing...

...

This scenario does not allow for updating an existing form. I think that
is fundamental to what we are trying to accomplish...

>

It is a variable length field. So if you only use the form 10
different ways at once shelter, then you use 0-9. If you want to use
it 999999 different times, then use whatever serial number you want.

>
> When a packet is fragmented, do each of the fragments have the same serial

Yes, definitely...

> Or is each fragment uniquely numbered? I was
> thinking that the fragments would be collated by date/time stamp.

Backwards. Each fragment is identified by serial number to match it to
the form in use and the specific instance of the form. The time stamp
changes with every packet transmitted...

I'm sure this topic has been raised by others, but I can't find the answer so I apologise for asking again.

Question 1: The aprs protocol reference version 1.0 makes no mention of carriage return characters in the ax25 information field, and I cannot see a purpose for them, so am I correct in presuming that APRS frames do not have to be terminated with carriage returns?

Question 2: Some of the frames I am receiving off air are terminated with <CR> and others are not. What action should I take when sending these to APRS-IS ? e.g. should I normalise all frames to the telnet end of line sequence <CR><LF> or should I send those frames which are terminated with <CR> as <CR><NULL><CR><LF> ?

Question 3: Are frames received from the APRS-IS "normalised", or do they preserve the original <CR> (if present) by sending it as <CR><NULL> so that the frame can be retransmitted exactly as it was sent?

73, Paula

Not required in the raw ax25 format. They are needed in the

ASCII domain to terminate the line.

Aprsd normalizes them to <CR><LF>

Yes they are normalized if they came from aprsd. I do not know
about other servers.

There is nothing that precludes sending a CR or LF via AX.25. HOWEVER,
the APRS spec assumes TNC's used in monitor mode which DOES preclude
sending or receiving CR or LF. Therefore, the raw I-frame for APRS must
NOT have either a CR or LF in it. If you are using a TNC not in KISS
mode, you must terminate each packet with a CR and/or LF so the TNC
knows the packet is complete.

I think this normalization should be done by all IGates, but that is my
personal preference. Glad to see aprsD does that.

javAPRSSrvr also terminates each line with a CR LF sequence (after
stripping any CR's and LF's from the received line).

This has been discussed in the past, I remember it well. The conclusion was that *all* frames transmitted on RF should be terminated with a CR. I remember it well because, at that time, UI-View didn't put a CR on RF

frames when the user was using KISS mode, and I changed it to make sure that every frame had a CR on it.

This wasn't simply about putting a CR on the frame as the SENDPAC character when using a TNC in terminal mode, it was about making sure the RF frame had a CR on it.

The discussions occurred in January 2001. I can't remember the details, but in my email archives I found a message I sent to the APRSSIG arguing that a CR wasn't needed on RF - see below. Obviously after that point I was persuaded otherwise.

```
*****
In article <LYR1643-129909-2001.01.17-12.45.57--roger#peaksys.co.uk@list
s.tapr.org>, Bob Bruninga <bruninga@usna.edu> writes
>Correct. If the spec does not specifically say a CR is required, then it
>should. That is the only way to ensure proper decoding with all programs,
>TNC's, modes, and links.
```

I'm having difficulty envisaging the situation in which it makes any difference whether or not a packet transmitted on RF includes a CR.
Etc...

```

hi list members
my question is as follows .

how easy is it to add to the aprs in the weather section
a terminal based weather station that runs on 1200 bps
n 8 1 , in real time in 1 minute intervals

stephen galowski

Here is the current list of APRS T0calls and Version nomenclature that I have updated. Previous one was June 2002 version 3.

I have added: APTWxx for Byon's WXTrak and WB6ZSU's APNAXx for APRServe.

- APA A-Filter, Alinco, etc
 - APAFxx AFilter.
 - APAGxx AGATE
 - APAXxx AFilterX.
 - APAHxx AHub
- APB Rabbit TCPIP microprocessors
- APC Windows CE, etc
 - APCYxx Cybiko applications
- APD APRSd, etc
 - APDTxx APRStouch Tone (DTMF)
- APE avail
- APF avail
- APG Gates, etc
- APH HamHud, etc
- API Icom, etc
 - APICQx for ICQ
- APJ JavaAPRS,JeAPRS,etc
 - APJAx JavAPRS
 - APJEx JeAPRS
- APK Kenwood, etc
 - APK0xx THD7's
 - APK1xx D700's
- APL Liunx applications
- APM MacAPRS, etc
- APN Network nodes, digis, etc
 - APN3xx Kantronics KPC-3 rom versions
 - APN9xx Kantronics KPC-9612 Roms
 - APNAXx WB6ZSU's APRServe
 - APNMxx MJF TNC roms
 - APNPxx Paccom TNC roms
 - APNDxx DIGI_NED
 - APNUxx UIdigi
- APO APRSpoint
- APP pocketAPRS, etc
- APQ avail
- APR APR8xx APRSdos,etc

APRDxx APRSdata, APRSdr
APRKxx APRStk
APRS Generic, (obsolete. Digis should use APNxxx instead)
APRXxx APRSmax
APRTLM used my MIM's and Mic-lites, etc
APRSTx APRStt (Touch tone)
APS APRS+SA, etc
APT TinyTrack
APTTxx Tiny Track
APT2xx Tiny Track II
APTAXx K4ATM's tiny track
APTWxx Byons WXTrac
APTV for ATV/APRN and SSTV applications
APU UView, etc
APU1xx UView 16 bit applications
APU2xx UView 32 bit apps
APU3xx UView terminal program
APV avail
APW WinAPRS, etc
APX Xaprs, Xastir, etc
APY etc, Yeasu, etc
APZ Experimental
APZ0xx Xastir (old versions. See APX)
APZPAD Smart Palm

I am brand new to APRS and have not got it running yet.
Are there two zip files that need to be downloaded for APRS-SA?

Has anyone done any implementation? I'd really like to be able to show off
the shelter list / forms feature!! Sprouls??? please?? Hurricaine season
is upon us, and active.

Wes

TAPR members:

Here is your chance to become rich and famous! Well, maybe not rich, but certainly famous.

The editorial board of Packet Status Register (PSR, TAPR's quarterly newsletter) is now soliciting articles, news items, etc. for the next issue of the newsletter. Topics related to digital Amateur Radio will be given preference and the editorial board reserves the right to determine what is suitable for publication.

E-mail your contributions to wallou@tappr.org ASAP because the deadline for the next issue of the newsletter is October 24.

73,

Stan Horzepa, WA1LOU, PSR Editor

People

I am wondering if there is a need to publish the APRSspec onto paper? I know it is available online, and that it is subject to change.

However it seems to be fairly stable, and is the sort of thing that I refer to all the time. Or I would if I had a paper copy for the shack.

Would people buy a copy if it were made available? Feel free to email me directly and I will summarise the responses.

Thanks

Darryl

I think if I ever wanted a printed copy, I'd print my own.

One problem I found with the approved version of the spec, was that it didn't have section header bookmarks - the draft versions did. So I bookmarked it myself in the style of the draft versions. If anyone else thinks that would be useful, the bookmarked copy is on my web site - <http://www.ui-view.com/aprs/ap101bm.zip>

Over the past few months, there has been some concern raised regarding

the use of APRS-IS to broadcast information available from other Internet sources for the sole consumption of Internet-connected clients (not for RF). The concerns expressed are multifaceted, but bandwidth is one of the major issues. At the risk of flames from those with their own agendas to promote, I would like to advance some principals and ideas on the use of APRS-IS and possible ways to expand its use without becoming a burden to those that support it. Most of these ideas are simply gathered from views expressed by others either here or elsewhere.

1) APRS-IS is a high speed backbone interconnecting local RF networks. Bob has stated a number of times that APRS was developed as a "tactical" protocol. APRS-IS provides "intelligent" linking of these individual tactical networks by the use of IGates and servers. If the primary purpose, today, of APRS-IS is to link RF networks, then any data injected into APRS-IS should also be of a form easily gated to an RF network.

2) APRS-IS is supported by donated equipment, bandwidth, and time. As such, it is the responsibility of those that use APRS-IS to minimize their impact on this donated resource while maintaining solid linking between RF networks. Data injected into APRS-IS in bursts creates peak loads that can overload the donated resources.

3) Internet access is not free and, in some parts of the world, can be very expensive for streaming data. This should encourage those of use with "cheap" bandwidth to be respectful of those that don't have that bandwidth. Server operators who inject data into APRS-IS where no RF network desires that information should rethink their distribution method out of respect for the other hams using the network.

Given the above principals, the question comes to mind "I would like to see more data from APRS-IS, what is the best way to inject that data?" There are two methods for placing data on APRS-IS: push and pull. The push method is used by WXSRRV to place weather events issued by the NWS (US weather service) onto APRS-IS for gating to RF. Dale has talked about making the WXSRRV a push-pull server where abbreviated watches and warnings would be "pushed" onto APRS-IS (still in an easily gated form) but the more verbose information would only be injected if someone sent a message to WXSRRV asking for the information. This would be a good example of using both push and pull effectively.

The pull method could be implemented by those experimenting with different information sources. It would reduce the impact on APRS-IS and provide meaningful information to APRS users on RF. For instance, a message to METAR asking for the closest weather would get a message back from the METAR "station" with the abbreviated METAR weather report. A message to FIRES for the closest fire would get a message back with the

closest fire information. The reason for posting here is this: we can make "standardized" messages for any of these.

My thought along this line is as follows:

Define different services. For instance METAR, FIRES, BUOYS, QUAKES, WXSVR, etc.

Have some "standard" queries. For instance ?NEAREST, ?LATEST 40mi (latest within 40 miles), ?NEAR 40mi (means within 40 miles), etc.

This would give us a great new use for APRS messaging, reduce the bandwidth used by non-RF related information, and give someone in the field a "mini-web browser".

Comments about defining services and message syntax?

In addition to providing "pull" services to all of APRS-IS, the specialized servers could also offer ports for clients to connect to directly receive the information that the server is generating. It is important, however, that only clients (no servers) connect to these ports. Servers connecting to other servers that are connected to these specialized servers can cause the data to be inserted into the general APRS-IS.

This mass interconnection of servers is also how loops occur on APRS-IS. Server sysops should review their configurations and reduce or eliminate most inter-server connections. Tier 2 servers should have single bidirectional feeds which connect to the core servers. There should not be multiple concurrent bidirectional feeds from a tier 2 server to the core servers. Nor should a tier 2 server arbitrarily create concurrent connections to other servers. The reasoning is simple: prevent loop conditions; reduce bandwidth requirements at other servers.

The Autumn 2002 issue of TAPR's journal, the _Packet_Status_Register_, is now available online.

You can download it, and past issues of PSR, from <http://www.tappr.org/psr> or via FTP from <ftp.tappr.org/psr>. The issue name is "Autumn_85_2002.pdf".

People

How widely implemented is the APRS compressed format. I want to do some decoding in a PIC and it seems to me that dividing by 91, and then converting from decimal degrees to degrees with decimal minutes may be outside the capabilities of the IC.

Also, I was wondering if there exists a reference C implementation for it and MIC-E decode? That would be better than re-inventing the wheel (again).

Many thanks

Darryl

Compressed format is implemented in Xastir, including compressed
objects and items.

The Xastir source code is freely available under the GPL license and
written in C. We can't promise that it'll be easy to understand or
that it's the best written or commented code in the world, but it
might suffice for your "reference implementation".

<http://sourceforge.net/projects/xastir>

Navigate to "CVS" and then "Browse CVS Repository". Most of the
decoding code is in "db.c".

You could also snag the entire source distribution and pick through
it at will. It's distributed in tar'ed gzip'ed format.

Once you include it directly in your software, you're required to

release your source code. No? The poison pill principle.

Maybe it would be possible to use code on a non-GPL basis with permission from authors of individual sections of XASTIR.

You can extract the algorithms from code that is distributed under the GPL license and then re-implement then. Given the length of the code in question, this is probably feasible. Of course, I would like to think that you would release your new code under a Berkeley-style license.

But, no one seems to answered the question about how widely the compressed format is implemented. My impression is that in the past it was not widely implemented. Has this changed? (Insert long whine here about APRS implement ions immutably cast in silicon here.)

True. You're required to make it available if the user requests it.
It doesn't have to be distributed with each binary though. It's all
in the "COPYING" file that's distributed with Xastir.

> Maybe it would be possible to use code on a non-GPL basis with permission
> from authors of individual sections of XASTIR.

Yes. This is possible and allowable. I think he was looking for
reference code though, not necessarily code to use outright. If you
do want to use that bit of code directly, let me know. We can
probably work something out. I think I wrote that portion. I
should be able to look up who did in any case.

It's always nice to have a working implementation to look at while
writing your own. The new version doesn't have to directly use any
code from the original. Just having something to test with that
does work is a real time-saver.

As always, Bill is looking at things with a critical eye. Keep it
up!

I did not answer previously since I figured that there would be a lot of posts about it!

As the digi sysop in Houston, I would guess that at least half of all packets transmitted locally are compressed packets.

Think:
Kenwood
Pic-E
TinyTracks

That accounts for a LOT of activity.

G'Day

There are two types of compression in APRS - MIC-E and Base 91.

MIC-E is fairly easy to impliment... Base 91 is much harder as it gives you a result that is 380926 points per degree latitude, or 190463 points per degree longitude.

Since all the APRS protocols use is usually defined as fractions of degrees, or fractions of minutes, or fractions of seconds, this number

is not easy to use.

Various people have commented that this protocol is not widely implemented for that reason. The math involved in getting a tracker to work on it is not nice in itself. The reason that base 91 was used was for accuracy, but for the minor use a full NMEA string is better used.

As for the copyright issue, I feel that looking at a code to see how they have implemented it is fine. But I cannot use many of the pieces of code since I want to be able to use some of the things that I am developing commercially, either by leasing the built units out, or by selling them commercially in the ham or commercial world.

Note that a GPL Copyright does not mean that the code cannot be sold
or otherwise profitted from, it just means that the source code must
be made available. I (or anyone else) am free to charge whatever fee
I think I can extract. If I can get someone to pay me \$1000 or
\$10,000 per copy, more power to me. The license does not exclude
that.

If you want to develop something for which you can charge a pretty
penny and you don't want them to see what's "behind the curtain",
I'd suggest you learn what you can from the code and spec, extract
the algorithms, then code it up from scratch.

[m:.x:.d:.] I'd add that if you do this - since you won't let your code
be free (as in speech) - consider contributing to the community that
helped you create your program (by sharing their code with you) by
giving some of the profits back to projects that help advance open
source.

I'd suggest things like gnome (<http://www.gnome.org/friends/>), or
KDE (<http://www.kdeleague.org/contribute.php>).

Not using linux? Well, still consider helping people who share code. GNU
is pretty platform independent. (
<https://agia.fsf.org/mp/order.py?make-donation=1>)

<soapbox>

as an aside - and I'm not pointing to anyone in particular - I find it
very silly that people in the amateur radio community don't "get" the
open source philosophy more readily.

People sharing code means more people see code, learn how to code

better, and don't re-invent the wheel every time. This leads to more and better software. Rinse. Repeat. Open Source is automatic elmering. But, elmering has fallen out of fashion, I think....

I'm amazed that no one has written and released a general APRS parsing library. Everyone seems to do it from scratch. Why? Wouldn't the community be better served by creating a portable standard library that could be easily used by others? Has it been tried? I've never been able to find any record of such a thing. (by the way, if you want to work on a general APRS library, email me. I'm game.)

IMHO part of the death of packet was the inability of the pbbs authors to feel confident, or benevolent, enough to release their code so other people could help move it forward. It's much more important to them to collect a relatively paltry amount of money than to help advance and preserve their HOBBY for future generations. And for those that keep the system closed and don't ask for money, I'm baffled. Why would anyone ever do this??

Of course, there are exceptions. And, again, I'm not directing this at anyone in particular. It just frustrates me to see literally thousands of college kids sharing code and learning how to make better and better software while our hobbies state of the art digital systems run - by and large - on dos software that is barely maintained.

So, i guess you can flame me. But, just stating an opinion....

>TinyTracks

They are Mic-E, I *think* the original question was about compressed format (base 91).

My experience suggests that it is not widely used. Also, because the level of support for compressed format varies between APRS clients, my recommendation to UI-View users is not to use it, unless they have a specific reason to do so.

Its called American greed! I'm proud to be an American don't get me wrong. However When you think that this is a hobby that does allot of community service, the folk that charge \$50-\$60 and higher to use their program is putting a big financial burden on the folks that just want to participate. There is something about the fact that it is against the law for me to make a dime with any of this software and they are trying to make \$50,000 to \$60,000 with it. Although I don't fully agree with your Open source idea. I do feel these programmers should contribute (They may in ways we don't see) to the hobby instead of making a buck from it. Thanks to open source and UIView there is still options available to everyone. 8)

But if you killed all open-source discussions, you'd miss all the
good technical issues. ;-)

> They are Mic-E, I **think** the original question was about compressed
> format (base 91).

Hard to tell. "Compressed" means one thing in the APRS Spec. It means another in everyday usage. I'd normally consider "compressed" to be either Mic-E or the Compressed lat/lon as defined in the spec. Too bad another name wasn't picked for the spec's "Compressed" description.

> My experience suggests that it is not widely used. Also, because the
> level of support for compressed format varies between APRS clients, my

> specific reason to do so.

And in the spirit of pushing the limits, I'd encourage all of the Xastir users and anyone else using with APRS clients capable of it to use compressed posits, compressed objects, compressed items, and anything else that's in the spec and not well implemented across all clients. That might encourage the authors to get off their duffs and implement what's in the spec.

Please note that Xastir doesn't implement everything in the spec yet either, so I'm thumbing my nose at our project as well. ;-)

Obligatory Open-Source: I'm for open-source. I release sources under GPL, BSD-style licenses, and in the public-domain. I also have some things I don't publish because I intend to make money on them, or because they could cause harm if released to the general populace and somebody had a mean streak in them. I'm not against making money with software. Some projects make sense to do that with, some don't. Anyone who claims that one way is the only/right way isn't seeing the whole picture.

It's mind-numbingly BORING, and it's incredibly negative to turn one
topic after another into a discussion of what amounts to a religion.
(IMHO, of course ;-)

Base 91 was used, I believe, so in the late 1990's so we all would be able to see printable characters on our screen. Go figure.

The "compressed" part of the name means it is a terse positional format, which it is, especially considering it gives better accuracy then the standard format or MIC-E. With SA being off, and the introduction of WAAS, we sorely need something like this.

NMEA can give the accuracy but it is very verbose.

As an aside, since the "compressed format" is not widely supported, I wonder how many authors would be willing to support a new protocol (not part of the APRS-SPEC) that is designed to be both computer friendly, accurate, and terse? Even using something as simple as BCD, you could get two digits per byte and very easy to parse and integer friendly.

I seem to recall UI-View went off the beaten path developing their own protocol. I wonder if they addressed this?

-Jeff

I would think that we could get away from the "printable" requirement these days. It'd be a big win if so.

Yes! I sometimes uses compressed objects/items just so that I can have precise positioning of the darn things. If I don't, they jump to one of the standard APRS grid positions. Very annoying.

If at least preliminary agreement on this could be made, Xastir would certainly implement it.

Much easier to do it with the Mic-E format. I designed that format to be
simple bit manipulation... trivial in a PIC...

The MIC-E is trivial apart from the degrees in the TO CALLSIGN having a protocol bug where 0-9 are 0x30->39; A-J are 0x41-4A and P-Y are 0x50-59. So much easier if it was 0->X as the characters... Then you just need to do a bitwise and to get rid of the message fields... Or the N/S fields...

But those integers were very carefully chosen so that all the math can still be done with single precision integers (16 bit) (as I do in APRSdos). If you want to retain the 1 foot precision, you need double precision, but by dividing by a constant, you can do it all in single

precision and still get posits to the nearest .01 minute (just like standard APRS formats)...

Id have to look up the details, but it was easy...

Bob, WB4APR

Id still go with Mic-E as the simplest and 100% fully implemented version...

Max and Others...

Thanks to all those who have answered questions on the APRS spec. It has been much appreciated. I am so glad that the spec is there and is so well written.

Since I was the one that the message from Curt was directed at about open source, and I commented that I was unable to use the GPL for various reasons, I have decided to comment. I know this is not an attack on me, but I think some things need to be said.

>[m:.x:.d:.] I'd add that if you do this - since you won't let your
>code be free (as in speech) - consider contributing to the community
>that helped you create your program (by sharing their code with you) by

>giving some of the profits back to projects that help advance open
source.

Personally I don't think that it would be appropriate for me to be supporting Open Source in lieu of opening the code up. Most of the ideas are from Ham Radio, so if I were to contribute, I would have to contribute to a Ham Radio organisation. After all, the open source people have done exactly zero to help me with this project - not the tools, spec, ideas, etc.

So I make a donation to TAPR - and in a way that TAPR needs most - in my time. I am not sure if any of you realise this, but I am now on the board of TAPR - as of the DCC in denver. I live in Sydney, Australia. Even to get to LA is a horrible 14 hour flight in a cramped 747. And I have made a commitment to be an active board member of TAPR, attending the board meetings a great personal cost to me.

I have never in my life seen a comment suggesting that PacComm or Kantronics should be opening their source code and giving it away, although I am sure that it has been said. I see that it is OK for them to keep their hard work closed source. After all it is their business.

When I realised the software to convert DXF files to MAP files for WinAPRS, I didn't release the source, but I made the software free. The wrong people would have needed to pay in order to use the software - the people who do things rather than the people who use things. I made the software available to anyone who needed it, but mostly changed the code as required. I recently opened the source too...

I have been part of the LINUX community longer than anyone I can think of, apart from LINUS himself. I was one of the few hundred members of the MINIX mailing list when he released LINUX. I love LUNIX, and run it

for servers. I am just as proud that I spend more time on my Windows XP laptop.

There is no requirement in Ham Radio to 'Get' the open source philosophy. I remember hearing Lyle Johnson talking about Ham Radio being the NATIONAL PARK OF WIRELESS. Funny thing is that you must PAY to get in to many National Parks. Access is FREE, just that you have to pay.

At this point I should also say what I do for a living. I am self employed - as a consultant engineer. I am struggling to make a living for myself - and so I need to make every cent count. If I can write some software and develop some hardware and sell it, at a price that is reasonable then there is nothing wrong with that.

>I'm amazed that no one has written and released a general APRS parsing
>library. Everyone seems to do it from scratch. Why? Wouldn't the
community
>be better served by creating a portable standard library that could be
>easily used by others? Has it been tried? I've never been able to find
>any record of such a thing. (by the way, if you want to work on a
general
>APRS library, email me. I'm game.)

That would be fantastic. You just need to make sure that the licenses is appropriate, and will allow the software to get used. There is cheap commercial software out there (like UI-View) that would have great troubles if they wanted to use a GPL'ed license code in their software [I have lost count of how many copies of UI-View I have registered just so I can pay roger some more for his software :-)]. The license would need to be open so that modifications to the parsing code were public regardless, but that the resulting application could be sold without restriction.

>From Curt

>to do that with, some don't. Anyone who claims that one way is the only/right
>way isn't seeing the whole picture.

Interestingly, there is no such thing as software placed into the PUBLIC DOMAIN - especially in the USA where Sonny Bono managed to extend the Copyright Act... The only way for anything to enter public domain is for the copyright to extinguish. There was an interesting article on that in the Linux Journal - October or november just inside the back cover.

Anyway that is too long an email...

Now that was me, but it was kind of a P.S. at the end of an on-topic message and wasn't intended to get sucked off separately into this thread.

I'm an open-source developer, but I'm not quite as in-your-face as some of the others. I just keep nudging here and there. ;-)

There are general purpose APRS parsing programs. People wrote them from scratch because there weren't any. I can think of at least three. XAstir. Aprsdec. and my aprsworld parser. Pulling the parsing routines out of XAstir and my parser is almost trivial, and I haven't tried aprsdec but I suspect it would be too!

> and my parser is almost trivial, and I haven't tried aprsdec but I
suspect
> it
> would be too!

[m:.x:.d:.] I stand (semi) corrected. There are programs, and they
include parsers. What I'm talking about is a general purpose _stand
alone_ parsing library that can be included, either via linking
(libaprs.so, libaprs.dll, anyone?) or source inclusion.

Aprsdec is a perfect example of a well developed parser, but to use it
effectively I'd be forced to write in perl. It's not general purpose.
Your aprsworld parser is well developed, but still doesn't quite fit the
bill as general purpose. Its designed to parse and stuff into a
database. Xastir has a similar issue, its parsing is fully intertwined
with the application. After looking at the code and thinking about how I
would make it generic, we may have different ideas as to what "trivial"
means.

i'd like to seriously propose that we create a parsing library that has
the following characteristics:

1> portable. This means not only that it will run on any (reasonable)
platform, but can be used from most languages. A linkable library is
probably the key here, although the ability to do source inclusion is a
plus.

2> generic. Doesn't make any presumptions beyond being handed data and
handing parsed data back. No dealing directly with a tnc or with tcp
streams. No mucking about with databases or files. No reliance on
application provided i/o.

3> useable. As a part of developing the library, creating stub classes/functions so it could be a drop in replacement for existing parsing routines inside programs. So, for instance, if I decided that I'd like to link to this library out of xastir, the library source should include stubs to make that possible. Oh, this is probably non-trivial. :-)

4> documented. While this wouldn't be a reference implementation, it should be documented clearly against the spec. not surprisingly, aprsdec does an incredible job of this, we should emulate that work.

5> free and open. You know what I mean.

There. Its more of an intimation to a proposal than an actual proposal, but you get my drift. I'm willing to work on it, but not alone - and not if this community doesn't see a need.

You can go to <http://sourceforge.net> and type in "APRS" in the
search box. You'll find some C++ class libraries, some Java stuff,
Xastir, APRSWorld, and others.

I guess I'll have to say it more often. I've long suggested that Kantronics would sell more units if they released either the full source or an SDK for their KPC-3's. Amazing little boxes but the existing software, as good as it is, isn't what it could be.

One of these months somebody will have time to start up an open source project either for the Kantronics or stock TNC-2's and we'll finally be able to make some good progress on the basic client and node systems.

G'Day All...

I need to appologise to Curt for the impression that he made comments that he clearly did not make. That was not my intention. Curt has at all times been very low-key with his suggestions on the use of open source software.

What I was intending to say was that low key comments by him and others were taken and conciderably extended. Carefully examining the area at the start of the first quoted area does reveal [M.X.D] or the last three letters of Max's call.

Where I really did stuff up was the following paragraph from "Patrick Karp" <pkarp@conwaycorp.net> where I wrongly attribited it... Sorry.

```
>> >From Curt

No, but any changes to the code fragments that were used... note the distinction... must be available, and by convention the source is distributed.

Open Source is not a guard against private enterprise. It does remove some of the more restrictive concerns about licensing and subsequent source distribution, and does attempt to keep those elements designated for full release stay fully available.

Already done on the TNC2. thenet and X1J node code is open source. Also, APRS
UI-DIGI was based on nordlink TNC code, but source was never released. He
appears to be in violation of the nordlink agreement by not releasing but
don't quote me.

I know. It might be a good start. The problem isn't the source - it's the development environment. Bet you a cold one of your favorite variety you can't compile the source to create a stock X1J ROM image.

Considering the questionable birth of X1J to start with I'd like to get something

going from a clean beginning. I think the source for a KISS implementation is available - that's where I'd start.

Give me two cold ones and I'll say more of the same.

Netrom (software 2000) was written in assembler, X1J was written in C by a englishman. What is questionable here? I take all the gossip from the late 80's with a grain of salt. Software 2000 left the amateur scene year's ago... Nordlink (of germany) is still involved and actually contributing much.

I thought the whole idea of open source was to share? Why throw away all their experience and start with KISS... which if you read Phil Karn's paper KISS was a kludge to begin with.

>englishman. What is questionable here?

I was going to write:

Nothing!

Software 2000 wrote Netrom.

Some folks disassembled it. Changed the order of some function parameters and released the source code. Software 2000 wisely left the amateur market for greener pastures where they would be rewarded for their efforts. That's good business - and a loss for Amateur radio.

Some folks in Arizona supported the released TheNet software for a while.

Then Dave, G8KBB, picked up on the TheNet code and supported it for a few years under the name X1... I think that was for eXperimental release 1 of a new TheNet code. His last release was X1 version J - thus X1J.

Some of Dave's additions were in C. The core is still the basic TheNet assembly.

Now, after a bit of web research I have to take back the "!" from Nothing. I don't believe their's any question that there was an original release of source from a disassembled Netrom.

Following this thread for some interesting discussion:

<http://www.mail-archive.com/linux-hams@vger.rutgers.edu/msg00393.html>

How that relates to the release of TheNet Version 1.0 source is a bit fuzzy and certainly not worth the effort do spend much time researching nor to be fully discussed yet again here.

Once again the "Vector Board" file archive showed up in a search for old code. <http://www.vectorbd.com/bfd/thenet/>

It appears the compile environment isn't as obscure as I thought. Should be able to come up with an old Microsoft C80 compiler and M80 assembler around here somewhere. The peephole optimizer might be a bit trickier to find, but if we don't try to shoehorn in all the features, it might not be necessary to go to the dual bank switching trick which will simplify things a lot.

What ever happens with this code branch, it'll forever carry the ghost of Software 2000.

> Software 2000 left the amateur scene year's ago...
>Nordlink (of germany) is still involved and actually contributing much.

Which doesn't change the reason that Software 2000 left the amateur scene.

>I thought the whole idea of open source was to share?

Some share more then others. Which is terrific if that's what one chooses to do. To have your efforts shared by others to your personal detriment is not a good thing. We see this today. Notice the lack of software coming from both Paccomm and Kantronics? Maybe if there were less shared ROMS in digi's and TNC's out there we'd be seeing new and better software.

Also read Steve's comment on why the source for Findu isn't open. It's down a couple paragraphs at <http://www.findu.com/>. He's right on!

Just because it's essentially free to copy (steal) software, doesn't make it cheap to development and support. It takes a lot of time to do it right and that's expensive in the commercial world. It's even expensive in the GNU world. Folks put in many hours doing some good work. It's a great thing that they donate that effort.

In the real world you pay for software support and updates on a regular basis. Successful organizations don't complain about that - they're happy for it. It provides them with new and better tools.

>Why throw away all
>their experience and start with KISS... which if you read Phil Karn's paper
>KISS was a kludge to begin with.

It's simple, it's universal and it works. The disadvantage of KISS in a TNC environment is usually overshadowed by many other system parameters. That applies even more so in the APRS network which is glowing example of what can be done using simple kludges.

Here's some packet stats from one of my systems what has been up just 70 days.
Add them up. That's close to two million packets. Not bad for using the kludge.
(No, this isn't APRS either...)

ax0 RX packets:730019 errors:0 dropped:0 overruns:0 frame:0
 TX packets:824784 errors:0 dropped:0 overruns:0 carrier:0

ax1 RX packets:285096 errors:0 dropped:0 overruns:0 frame:0
 TX packets:59894 errors:0 dropped:0 overruns:0 carrier:0

ax2 RX packets:0 errors:0 dropped:0 overruns:0 frame:0
 TX packets:59817 errors:0 dropped:0 overruns:0 carrier:0

Bottom line. We will have more and better software if we respect those
folks developing it. Either by respecting the GNU license or by paying
for what we use from folks in business.

>-Jeff

73,
Bill - WA7NWP

PS. To keep this at least a microBit on topic, the plain text nature of the
current

APRS feed is a good thing. Save the compressed binary transport for the next
generation where it can be part of a clean rewrite.

PPS. Another current example of involuntary software sharing. There are now two
commercial spinoffs of Byon's Tiny Trak using "shared" source and utilities.

Bill:

I'm confused. You suggest a open source project for the TNC2 or other TNC's might be a good thing, and now are slandering European packet radio organizations as well as apparently condemning the whole open source movement.

Could you have been trolling here?

No matter, I'll bite a little.

First, do we agree that Open source and theft are not the same thing? I'm not sure if you understand the difference. I do, and understanding this is fundamental to any discussion.

On Mon, 11 Nov 2002 11:47:59 -0800, Bill Vodall - WA7NWP wrote:

>Software 2000 wrote Netrom.

Yes, Software 2000 was a commercial company and the product was copyrighted. Source code was not released although I have found evidence of some sharing of ideas between Nordlink and software 2000.

>Some folks disassembled it.

That was stated. And based on what you said, Software 2000 had clear cause of action against NordLink and the individuals involved. Remember, Software 2000 did not make the product Open Source. Yet for whatever reason, Software 2000 chose not to take legal action, to the best of my knowledge.

Yet here you are, 10 years later, beating the same slander drum against

fellow amateurs. While it may or may not be true, I think the fact Software 2000 chose not to exercise its rights means third parties should not beat the slander drum 10 years later.

>Some folks in Arizona supported the released TheNet software for a
>while.

Jack Taylor n7oo. And your stating he is thief also?

>Then Dave, G8KBB, picked up on the TheNet code and supported it for
>a few years under the name X1...

And now we get to Dave, who I was referring to. So it is your opinion he is also a criminal?

And what about Marco Savegnago, the author of UI-Digi? APRS crook?

And how about the authors of NOS, who "stole" the netrom protocol (which apparently was copyrighted) and put it into NOS?

Bottom line, Software 2000 chose not to enforce it's rights under the law, and no evidence even exists of a tort letter being sent to Nordlink. At a minimum, this should have been done.

>Following this thread for some interesting discussion:

>

><http://www.mail-archive.com/linux-hams@vger.rutgers.edu/msg00393.html>

The above was from ~1999, memories getting fuzzy. Here are some from around the time it all happened (1990):

<http://groups.google.com/groups?selm=8906090737.AA00657%40ucbvax.Berkeley.EDU>

<http://www.cnunix.com/ftp/hamradio/thenet/thenet.flame>

<http://groups.google.com/groups?selm=719640550snx%40skyld.UUCP>

<http://groups.google.com/groups?selm=10857%40platypus.uofs.uofs.edu>

>>Software 2000 left the amateur scene year's ago...

>>Nordlink (of germany) is still involved and actually contributing
>>much.

>

>Which doesn't change the reason that Software 2000 left the amateur
>scene.

What is the reason they left? (facts please) You do understand the reason NordLink developed TheNet is that Software 2000 had stopped supporting its product? At worst, the effort may have hastened their withdraw but they where already on the way out.

>>I thought the whole idea of open source was to share?

>

>Some share more then others. Which is terrific if that's what one
>chooses to do. To have your efforts shared by others to your personal
>detriment is not a good thing.

No it is not. That is why there is a whole section of law called copyright, trademark and patents. Even a section of the U.S. government devoted to it.

Bill, I run a commercial company. I've also had designs and trademarks stolen. Often a simple threatening letter from my attorney stops it in its tracks. I'm not saying this is right, but by the same token, slandering someone in a public newsgroup is not right unless you are willing to go to the mat with them. Software 2000 chose to slander Nordlink on the newsgroups and at TAPR board meetings instead of doing it the right way. Regardless of the "truth" their methods tell me alot about the individuals.

>Notice the lack of software coming
>from both Paccomm and Kantronics? Maybe if there were less shared
>ROMS in digi's and TNC's out there we'd be seeing new and better
>software.

Again, you are confusing Open Source with theft. They are not the same thing. I'd suggest turning in some of those ROM thieves you know into Paccomm and Kantronics instead of using it as a argument against open source.

>Also read Steve's comment on why the source for Findu isn't open.
>It's down a couple paragraphs at <http://www.findu.com/>. He's right on!

In this country, anyone is free to flush their source code down a rathole if they so chose. Guess some of us are quite happy a fellow in Finland named Linus decided he didn't want to emulate this!

Maybe you should check this site out:

<http://www.aprsworld.net>

Put together originally by a high school student. He was so misguided he released it as open source. And for his punishment he was awarded a

scholarship to college by the IEEE.

<http://aprsworld.net/info/sponsors/>

Some capitalists do DO open source.

>Just because it's essentially free to copy (steal) software, doesn't
>make it cheap to development and support.

Again, your confusing thief and open source. Of course it is not cheap, but some people who write source code for fun want their efforts to live on after them. Often it doesn't, but sometimes it does. But it is their choice.

>In the real world you pay for software support and updates on a
>regular basis.
>Successful organizations don't complain about that - they're happy
>for it. It provides them with new and better tools.

I think I spent about \$5000 on software last year, close to \$15,000 so far this year. Your point?

>>Why throw away all
>>their experience and start with KISS... which if you read Phil
>>Karn's paper KISS was a kludge to begin with.
>
>It's simple, it's universal and it works.

It is also from 1985. KISS is decoupled from the radio environment. Phil even mentions this. If you browse some of those netrom thieves sites in Europe you'll discover they have gone on to do variants of KISS addressing this called SMACK and 6pack and further have developed something called DAMA (from the NordLink thieves).

>Here's some packet stats from one of my systems what has been up
>just 70 days.
>Add them up. That's close to two million packets. Not bad for
>using the kludge.
>(No, this isn't APRS either...)

It is NOS of course. I used checksum KISS on all my NOS nodes. Makes a big difference. Still, I don't understand your point. You blast two million packets in the air, and you say "not bad"? A better metric would be how much actually data got sent on those 2 million packets.

>Bottom line. We will have more and better software if we respect
>those folks developing it. Either by respecting the GNU license or by
>paying for what we use from folks in business.

Of course. The people you are slamming long long ago left the scene so isn't
it time to move on?

>PS. To keep this at least a microBit on topic, the plain text nature of the
>current APRS feed is a good thing.

In 1985 or 1990 it might have been. Today it is just plain inefficient and
what we have is not well suited for small microcontrollers.

>Save the compressed binary transport
>for the next generation where it can be part of a clean rewrite.

I wouldn't discourage anyone from doing this. APRS works on the principle
that you do something and then it gets implemented in the spec. If someone
wants to do a binary compressed format for ham AVL, I'd highly encourage it
as the spec does not move fast enough (and that is a whole other topic of
discussion).

>PPS. Another current example of involuntary software sharing.
>There are now two
>commercial spinoffs of Byon's Tiny Trak using "shared" source and
>utilities.

??

Again, there is a difference between theft and open source. Byon, as best I
can tell, released too much and didn't protect himself well enough. I'm sure
he has learned from this, but don't try and confuse the issues. The TinyTrak2
is a commercial product, not open source.

-Jeff

G'Day All

Thank you for reading this message. TAPR provides this mailing list along with others as a service to their members and the Ham Radio community in general. Providing this service and other services such as our FTP site and the cost of developing new products like the Pic-E and EasyTrak, costs money.

We are more than happy to provide these resources to the entire Ham Radio community, but we do ask that you do consider joining TAPR. A good way to see what we're up to is to take a look at the latest issue of our quarterly journal, the _Packet_Status_Register_ which is available for download at
<http://www.tapr.org/PSR>

Membership in TAPR is only US\$20 regardless of whether you live in Tuscon, Arizona, or Sydney, Australia. If you want to join, or if your membership is coming up for renewal, please visit www.tapr.org on the Web for details. Specifically you can go to the following page for information

<http://www.tapr.org/tapr/html/Fmembership.html>

Darryl Smith, VK2TDS
TAPR Board Member

P.S. I have recently joined the board as its first non-North American board member. As part of my Board duties, I have agreed to have overall responsibility for membership. If anyone has any questions or concerns about membership or TAPR in general, please EMAIL me. I can also be

contacted by phone with prior arrangement

G'Day

TAPR have decided to introduce some changes to support those members of TAPR who are putting time and energy into the various publications that TAPR puts out each year.

Three Month Membership Extension for Packet Status Register (PSR)
Articles

--

>From the next issue of PSR, members who have articles published in the PSR magazine will have their membership of TAPR extended by three months. It is hoped that this will encourage members to write for the magazine. The deadline for articles for the next issue of PSR is mid-January. More information on submitting articles, and on obtaining copies of the magazine can be found on <http://www.tapr.org/tapr/html/Fpsr.html>

Six Month Membership Extension for Digital Communications Conference (DCC) Articles

>From the 2003 DCC, planned for somewhere in the Eastern USA, TAPR will be offering Six Month membership extensions for all members who have papers published in the proceedings. Whilst we would dearly love all authors of papers to attend the conference, we recognize that there are reasons that members cannot attend the conference - so the requirement is only on having your paper published. This is of course in addition to the complimentary copy of the DCC proceedings that each author is entitled to.

We are looking for papers on subject within the bounds of Digital Communications, as it applies to Ham Radio, on all levels. All you need is something to say. If you feel that you are unable to write a paper because you do not have the time, or writing a paper is outside your area of expertise, please contact me. I will attempt to find someone who will be able to help you with getting the paper written.

More details on the conference itself will be made available early in 2003, along with a formal call for papers. Until then you can examine the DCC area of the TAPR www site for details on past conferences by looking at <http://www.tapr.org/dcc/>

Darryl VK2TDS

Dear Sir or Madam

If you are a smoker in the UK, or in the ROI, then we have something for you.

You are probably fed up with paying high prices for your cigarettes and tobacco.
Take a look at what we can do for you at
<http://www.advertiger.com/bs/?E=b082ba8260f6eb4e891a3e2b03ffc961>

We can send you, legally, by registered air mail, direct to your door, 4 cartons of cigarettes or 30 fifty gram pouches of rolling tobacco (all brands are available) from only 170 Euros - about 105 pounds - fully inclusive of postage and packing. Why pay more?

If you would rather not hear from us any more, this link will ensure that you are not bothered again.
<http://www.advertiger.com/bs/off.php?E=b082ba8260f6eb4e891a3e2b03ffc961>

Yours faithfully.
British Smokers

<http://www.advertiger.com/bs/?E=b082ba8260f6eb4e891a3e2b03ffc961>

Minor Typo on Page 94 of the APRS Spec... Under Appendix 1 - APRS Data formats.

The table for AX-25 UI-Frame format lists the FLAG at the end of the packet being 2 bytes long. The correct number is 1, and it may be shared with the next packet

I am proposing to add APVxxx for IRLP, ILINK, ECHOLINK and any othe Voice

over IP system if it needs to send out a node STATUS packet to its users.

APVRxx is for IRLP

APVLxx is for I-LINK

APVExx is for ECHO link

Here is the current list of APRS T0calls and Version nomenclature that I have updated. Previous one was Sept 2002.

APA A-Filter, Alinco, etc

APAFxx AFilter.

APAGxx AGATE

APAXxx AFilterX.

APAHxx AHub

APB Rabbit TCPIP microprocessors

APC Windows CE, etc

APCYxx Cybiko applications

APD APRSd, etc

APDTxx APRStouch Tone (DTMF)

APE avail

APF avail

APG Gates, etc

APH HamHud, etc

API Icom, etc

APICQx for ICQ

APJ JavaAPRS,JeAPRS,etc

APJAx JavAPRS

APJEx JeAPRS

APK Kenwood, etc

APK0xx THD7's

APK1xx D700's

APL Liunx applications

APM MacAPRS, etc

APN Network nodes, digis, etc

APN3xx Kantronics KPC-3 rom versions

APN9xx Kantronics KPC-9612 Roms

APNAxx WB6ZSU's APRServe

APNMxx MJF TNC roms

APNPxx Paccom TNC roms

APNDxx DIGI_NED

APNUxx UIdigi

APO APRSpoint

APP pocketAPRS, etc

APQ avail

APR APR8xx APRSdos,etc

APRDxx APRSdata, APRSdr

APRKxx APRStk

APRS Generic, (obsolete. Digis should use APNxxx instead)

APRXxx APRSmax

APRTLm used my MIM's and Mic-lites, etc
APRSTx APRStt (Touch tone)
APS APRS+SA, etc
APT TinyTrack
APTTxx Tiny Track
APT2xx Tiny Track II
APTAXx K4ATM's tiny track
APTWxx Byons WXTrac
APTV for ATV/APRN and SSTV applications
APU UView, etc
APU1xx UView 16 bit applications
APU2xx UView 32 bit apps
APU3xx UView terminal program
APV Voice over Internet applications
APVRxx is for IRLP
APVLxx is for I-LINK
APVExx is for ECHO link
APW WinAPRS, etc
APX Xaprs, Xastir, etc
APY etc, Yeasu, etc
APZ Experimental
APZ0xx Xastir (old versions. See APX)
APZPAD Smart Palm

Authors with similar alphabetic requirements are encouraged to share their address space with other software. Work out agreements amongst yourselves and keep me informed.

de WB4APR, Bob

TAPR members:

The editorial board of Packet Status Register (PSR, the quarterly Newsletter of TAPR) is now soliciting articles, news items, etc. for the next issue of the newsletter. Topics related to digital Amateur Radio will be given preference and the editorial board reserves the right to determine what is suitable for publication.

As a bonus, if your contribution is published in PSR, your TAPR membership will be extended by 3 months.

E-mail your contributions to wallou@tapr.org ASAP because the deadline for the next issue of the newsletter is January 26.

73,

Stan Horzepa, WA1LOU, PSR Editor

Hi all,

I've just joined the list... Ciemon (pronounced Simon) Dunville G0TRT; aged 35; living near Ipswich in the UK; licensed for 12 years; using APRS for around 8 years; programming experience limited to a bit of C and Smalltalk.

So why have I joined the list? Well after so many years of taking, I thought I'd try and give.

Almost 2 years ago now the first APRS spec was released, after a lot of hard work. As time moves on and software is developed, maybe the protocol could do with updating too. So I'm offering my services to help in whatever way/shape/form I can. Be it writing any revisions to mediating any heated debates that will inevitably occur if the spec is revamped.

So what are your thoughts?

73.. Ciemon G0TRT

Dear developer,

The attached message was sent today to a few lists. There are 2 other methods to set the filter which are more target for you as developer if you want to enable the possibility to have a field in your applications where the users can enter their default filter definition and that is the passed to the server during connection/logon. They will then not need to send an APRS message initially. Of course can they send a message to change the

filter at a later time.

Method #1

The server logon string is checked for a filter keyword and anything after that is treated as a filter definition. The filter keyword must be the 8th argument. For example:

```
user SM5NRK pass 12345 vers Test 1.0 filter r/63/16/1000 t/wn
```

Method #2

The filter definition can also be sent in a comment line between the client and the server. The comment line must start with #. For example:

```
user SM5NRK pass 12345 vers Test 1.0  
# filter r/63/16/1000 t/wn
```

73 de sm5nrk/Roger

=====

Dear all,

Introduction:

The APRS-IS full feed today has a lot of traffic and requires a high bandwidth, in particular for the APRS-IS server sites, but also for some of you that connect that are only interested in the particular traffic. To accommodate this a number of servers have special regional feeds which filter the traffic. There are also some weather specific feeds available. But all these are setup according to what the server operator "thinks" will be good for the users. Now we can take this one step further.

Now will each of you be able to select what traffic you are interested in and the server will create a unique feed for you. There is great flexibility to construct your personal feed.

How does it work?

Pete Loveall AE5PL has written the APRS-IS server software `javAPRSSrvr` in java which is used by a number of servers. Pete has been kind to create some hooks into his server software so I have been able to write a filter add-on, `javAPRSFilter` (also in java). These 2 applications work together to provide this filtering. Status on the APRS-IS servers can be found here:
http://ahubswe.net/aprs_stat.asp

You define the filter by doing the following:

1. Connect and logon to a filter enabled port on a server
2. Send an APRS message to the server requesting the filter you want

Filter commands

There are 4 different kinds of filters that can be used in any combination. Each filter is working independent and is additive to the feed. This mean if the filter finds a match it will be passed to you. The filter commands in the APRS message to the servers call is starting with the word 'filter' (without quotes) and each filter command is delimited by a single space. A message with just 'filter?' (without quotes) will return the current filter definition.

#1 Range filter

The range filter will pass all stations and their beacons, status, messages etc within a distance from a set location. It will also pass messages to stations within the filter and positions of the message sender even if they are outside the range. Up to 3 range filters can be used at the same time to extend the areas when you have problem to find a good circle match.

Syntax: r/lat/lon/dist [r/lat1/lon2/dist2 [[r/lat2/lon2/dist2]]

Where: r = range command

lat = latitude in degrees (no decimals). Negative for south

lon = longitude in degrees (no decimals). Negative for west

dist = distance in kilometers from lat/lon.

I'm sorry we don't use miles here in Sweden ;-)

Samples: r/55/-4/600 This will pass all traffic for UK
r/37/-81/1500 This will pass all east cost US traffic

#2 Prefix filter

The prefix filter will pass traffic based on if the sender's call starts with a specific pattern. Up to 10 patterns can be defined at the same time.

Syntax: p/p1/p2/p3... (up to 10)

Where: p = prefix command

p# = The prefix (starting) pattern

Samples: p/K This will pass all traffic from stations starting with K
p/SK/F This will pass stations starting with either SK or F
p/SM5NRK This will pass all traffic from SM5NRK and any SSID at the end

#3 Budlist filter

The budlist filter will pass traffic based on exact match of the sender's call. Also the SSID is part of the exact match. If you want all SSID use prefix filter above. Up to 10 calls can be defined at the same time (if they can fit in a single APRS message).

Syntax: b/call1/call2/call3... (up to 10)

Where: b = budlist command
call# = The prefix (starting) pattern

Samples: b/SM5NRK This will pass all traffic from SM5NRK without any SSID
b/SM5NRK-5/SK5UM This will pass all traffic from SM5NRK-5 and SK5UM

#4 Type filter

The type filter will pass traffic depending on the packet type. More than one type can be defined in one single command.

Syntax: t/type

Where: t = type command
type = is one or more of the following letters
p = Position packets
o = Objects
i = Items
m = Message
n = NWS Weather
w = Weather
t = Telemetry
q = Query
s = Status
u = User-defined

Samples: t/p This will pass all traffic with a position
t/w This will pass all weather traffic. For positionless weather objects the corresponding position packet will also be sent when it is next heard
t/mos This will pass all messages, objects and status traffic

Remember that the APRS message must start with the word filter and the the commands.

The above filters can be combined as explain above. Each filter will however working independent of the others, for example:

filter r/63/16/1000 r/55/-4/600 p/F b/AE5PL t/s

The above filter will pass all traffic within Nordic (range#1) AND UK (range#2) AND stations starting with F (prefix) AND from AE5PL (budlist) AND all status traffic (type).

Where to connect?

This is up to each server operator if/when they will provide this type of service. The following servers and ports have this enabled as far as I know.

ahubswe.net:14580
aprsca.net:14580
aprseast.net:14580
aprswest.net:14580

I welcome any comments, suggestions and complains. I monitor the UI-View and APRSSIG lists.

73 and have fun
Roger Bille/SM5NRK

--- Excerpted from the APRS101.pdf file -----

APRS Data Extensions: a fixed-length 7-byte field may follow APRS position data. This field is an APRS Data Extension. The extension may be....:

PHGphgd Station Power and Effective Antenna Height/Gain/Directivity

Power, Effective Antenna Height/Gain Directivity	The 7-byet PHGphdg Data Extension specifies the transmitter power, effective antenna height-above-average-terrain, antenna gain and antenna directivity. APRS uses this information to plot radio range circles around stations.
---	--

The 7 characters of this Data Extension are encoded as follows:

Characters 1-3 PHG (fixed)	
Character 4	p Power code
Character 5	h Height code
Character 6	g Antenna gain code
Character 7	d Directivity code

Example of the PHG Data Extension: PHG5132 (reference a table that is included in the spec)

Another example: =4903.50N/07201.75W#PHG5132

Modify the Protocol Spec to add a new Data Extension parameter called SCC (Station Configuration Code). It is defined as:

- o Starts with the sequence: "SCC" and is at least 6-bytes long
- o Ends with either a " " or by virtue of being at the end of the frame
- o There is no limit to how long this field can be
- o This is a variable length field...not requiring that all stations fill-in all values.

SCC parameters include (in order of decreasing ability for the operator to provide accurate information):

- o 2-byte designation of frequency of operation
- o 1-byte Network Personality designation
- o 1-byte Power designation
- o 1-byte Antenna Gain designation
- o 1-byte Antenna Pointing Vector designation
- o 1-byte Antenna Height (Above Mean Sea Level) designation
- o 1-byte Antenna Height (estimated Height Above Average Terrain) designation

Empiracally: SSCbsnpgvmt

Examples of valid SCC's (with "real values" included):

SCCVK1NLAKP
 SCCVK1NLAK
 SCCVK1NLA
 SCCVK1NL
 SCCVK1N
 SCCVK1

Below are examples of the first two variables (2-byte frequency designation and 1-byte Network Personality designation). I have ideas on the others, too...but this is alot of information for folks to digest...so I'll stop there):

SCC = Field-flag

=== 2-byte designation of frequency of operation ===

b->	(X)tra	(L)ow	(M)ed.	(H)igh	(V)ery	(U)ltra	(S)uper	(E)xtr

P	19-kHz	190-kHz	1.9-MHz	19-MHz	190-MHz	1.9-GHz	19-GHz	190-GHz
Q	20-kHz	200-kHz	2.0-MHz	20-MHz	200-MHz	2.0-GHz	20-GHz	200-GHz
R	21-kHz	210-kHz	2.1-MHz	21-MHz	210-MHz	2.1-GHz	21-GHz	210-GHz
S	22-kHz	220-kHz	2.2-MHz	22-MHz	220-MHz	2.2-GHz	22-GHz	220-GHz
T	23-kHz	230-kHz	2.3-MHz	23-MHz	230-MHz	2.3-GHz	23-GHz	230-GHz
U	24-kHz	240-kHz	2.4-MHz	24-MHz	240-MHz	2.4-GHz	24-GHz	240-GHz
V	25-kHz	250-kHz	2.5-MHz	25-MHz	250-MHz	2.5-GHz	25-GHz	250-GHz
W	26-kHz	260-kHz	2.6-MHz	26-MHz	260-MHz	2.6-GHz	26-GHz	260-GHz
X	27-kHz	270-kHz	2.7-MHz	27-MHz	270-MHz	2.7-GHz	27-GHz	270-GHz
Y	28-kHz	280-kHz	2.8-MHz	28-MHz	280-MHz	2.8-GHz	28-GHz	280-GHz
Z	29-kHz	290-kHz	2.9-MHz	29-MHz	290-MHz	2.9-GHz	29-GHz	290-GHz

Network Personality (n)

A 1-byte (Base36 representation of a binary value) calculated as:

Digipeater (WIDEn-N)	00000#
Digipeater (TRACEn-N)	0000#0
Weather Station	000#00
Internet Gateway	00#000
RF Gateway	0#0000
Backbone Router	#00000

Binary Sum & display as a 1-byte Base(36) value

Example: Widen-N digi, WX station and IGate

000001
000100
001000

001101 = 13 decimal, "D", BASE(36)

Wow! This information can be embedded right into the frame by having client-side software include fields that the operator fills out...and does the encoding for them. On the RX-side...client-side software can easily parse out this information and offer users a wide range of options in displaying stations on their map.

Do you want to know all of the stations capable of IGating? Easy! The best part is that it doesn't matter what the display icon is!

Lastly...even if you don't agree with this proposal, you are to be saluted for reading through it and considering it.

Kind Regards,
Ev Tupis, W2EV

Hi all,

Well I offered my services and only a couple replied off list, so in an attempt to get the ball rolling...

If you're an APRS software author could I ask you to send the following please:

1. Name and callsign.
2. Software under development and OS.
3. If you are willing/have the time/inclination to participate in APRS spec development.
4. Any limitations.

Short replies preferred please to get things rolling.

Oh, and if you're an author and can't for whatever reason participate, could you please acknowledge this message so that we're all aware of your stance as the spec is developed.

Thank you

Ciemon G0TRT

You asked for it...

Darryl Smith, VK2TDS

1. AntiTracker Basic
www.radio-active.net.au/web/tracking/antitracker.html

PIC based, uploads positions in NMEA format (receive only)

Decodes Positions only. Does not decode COMPRESSED (does do
MIC-E)
Decodes above packets when sent in third party format from an
igate
Beta Testing
CCS C

2. AntiTracker Pro

PIC Based, uploads in GARMIN binary format to a GPS
Will soon decode icons in addition to above
Beta Testing
CCS C

3. OziAPRS <http://radio-active.net.au/web/gpsaprs/oziaprs.html>

Receive only APRS for OziExplorer.
Windows Based
Interface in VB
APRS Decoding based on libaprs2 by Max (mxd@wilder.net)
Will have server built in eventually.
Alpha Testing

4. BroadcastAPRS

Receive only APRS designed for doing live webcasts of events
Designed so that any size icons will work, and it will always
look good
Will have autotrack
Will soon be integrated with libaprs2
VB
Totally Unreleased.
Basically designed for my consultancy business where I have the
need to do the occasional webcast when I do tracking.

5. gAPRS

APRS server for GPRS, or other link layer on the internet where
the IP address changes constantly
Translates IMEI number into a callsign, and converts NMEA string
into an APRS string
Designed for the WMCS M110 GPRS/GPS tracking unit

Am I prepared to work on spec development. Yes.

How do other servers handle the extra parameters? Ignore them, or
refuse to log on the user?

> Method #2
> The filter definition can also be sent in a comment line between the client
> and the server. The comment line must start with #. For example:
>
> user SM5NRK pass 12345 vers Test 1.0

Can't such comment lines come in from all kinds of sources? What if
a comment line containing filter parameters comes in from some other
source through and igate. Can the igate's filtering parameters then
get changed by someone on RF near the igate?

Perhaps the comment line has to be immediately following the logon
line? If so, that would reduce the above problem considerably.

> You define the filter by doing the following:
>
> 1. Connect and logon to a filter enabled port on a server

This is the method we might have had problems implementing in
Xastir. Xastir has no concept currently of the "callsign" of the
remote server. We aren't parsing it out for anything currently.
Xastir only knows the ip address or hostname. If the callsign of
the remote server were always part of the hostname, we could still
have a problem in those cases where the user specified the server by
IP address. Yea, these are all workable, but they're a bit of a
pain.

I'm hoping to be able to use the first method listed above if other

servers don't have a problem with the extra parameters.

aprsD and javAPRSSrvr w/o javAPRSFilter ignore them. I don't know about
AHub.

> Can't such comment lines come in from all kinds of sources?
> What if a comment line containing filter parameters comes in
> from some other source through an igate. Can the igate's
> filtering parameters then get changed by someone on RF near the igate?

No. A comment line seen on RF will have an AX.25 header on it making it
a standard packet from the IGate. Servers do not pass comment lines.
The IGate would have to directly generate the comment line with the
filter keyword and filter parameters for the filter to be changed.

The messaging method is designed to allow users to easily change the
filter on the fly using standard APRS client software. There is no
requirement for the client software to know the callsign of the server.
The only requirement is for the user to know the callsign of the server
that they are currently connected to.

> I'm hoping to be able to use the first method listed above if
> other servers don't have a problem with the extra parameters.

This is how UI-View and APRS+SA have implemented the feature. We have
not had any reports of problems with this method (other than the usual
bug reports/enhancement requests which we welcome).

*** If the line came from RF, it would have a callsign>path:data construct. It should not be an issue.

*** I did not implement the Message method in APRS+SA. I did implement both the extended login string and # comment method. In the APRSERVE.TXT file which APRS+SA uses, and I suspect Xastir has something similar, I added the ability to add the complete filter. This means, # filter r/63/16/1000 t/wn. So an entry would be of the form:
server port comment # filter r/63/16/1000 t/wn

where server is the server address, port is the TCP/IP port, comment is any additional text except octothorpe, "#", which is used to delimit the start of the filter data. For APRS+SA, this made the new file backward compatible with older versions. I do require the word "filter" to be specified as there may be additional keywords used for filters in the future.

Just for the record aprsd 215b9 has a means of setting a port filter at login. This was done several months ago and only applies to the new OmniPort, 14600. I hoped this would inspire a gradual move to using a single port for all user streams. Of course it could also be expanded to any type user defined filter.

See:

<http://www.wa4dsy.net/aprs/ports.html#omniport>

Messages are addressed to "SERVER" , not the servers callsign. The filter can be set prior to login.
eg:
pf(all,history)
user wa4dsy pass 12345 vers macaprs 1.0

Note the login string is not modified. No comment lines are used. The same function that parses the login also parses the filter command.

And, after login commands can be put in messages addressed to SERVER.

eg:
WA4DSY>APRS::SERVER :pf(all,history)

To prevent other aprs servers from responding to the message the following is done:
Messages addressed to SERVER are swallowed and not repeated. Message must be from login callsign.

Aprsd can connect to other aprsd servers and automatically issue a port filter command. The aprsd.conf file server login syntax was expanded to accomodate this.

eg:
Server wa4dsy.net 14600 server-ro portfilter(local)

Forwarded from APRSIG

Here's what I'm hoping to produce in the near term:

1. An APRS-IS translator that'll translate a full stream and provide it to

clients in the new format.

This will probably be an NT service, unless someone wants to volunteer to write a Unix daemon.

2. An ActiveX control to interface with the translator.

Just tell it to connect, and it'll raise an appropriate event whenever a recognized message is received. If it doesn't recognize the message format, it'll pass the raw data to a generic event so you can parse your own messages.

I think I'll also add an encapsulation message type for carrying standard APSR messages. That way, you can drop the control into an existing application, and use your existing parser to handle those messages that aren't translated yet.

I figure that if I can get this going, it really doesn't matter if anyone else adopts it as a standard. It'll still be useful to me, and if the translator becomes a standard feature on APRS-IS servers it'll make client development easier and reduce bandwidth usage, at least a bit. Notice that the example message took only 18 bytes for time and position with better precision than current formats allow.

Scott / N1VG

Thanks to everyone who responded off-list. I figure it's time we had something concrete to fight about, so here's my proposal for a general message header and two primitive message types.

Message Header Format

bits: 1	7	8	8	

ext_flag	length	msg_type	ext_type	message body...

ext_flag - A '1' in this field indicates a 16-bit message ID.

length - Length of message, inclusive of message ID.

msg_type - The message ID if ext_flag = 0, otherwise the low byte of the message ID

ext_type - High byte of message ID. Only present if ext_flag = 1.

This message type scheme allows for 65,792 message types (256 standard and 65,536 extended).

8-bit message IDs are reserved for common, standard messages. 16-bit IDs are used for less-frequently used messages and experimental message types.

0-byte messages are supported for instances where the presence of the message type alone conveys the required information.

No CRC is included, as a reliable transport layer is assumed.

All numbers are little-endian.

Position format:

All positions reference the WGS84 datum using decimal degrees.
Coordinates are represented by 32-bit unsigned integers as follows:

Integer longitude = (longitude + 180) * 2²³
Integer latitude = (latitude + 90) * 2²⁴

Altitude is in meters above WGS84 ellipsoid, stored as a 16-bit unsigned integer.

Time format:

All times are in seconds elapsed since 1 Jan 1970 00:00:00.0 UTC, stored as a 32-bit unsigned integer.
This is equivalent to the standard Unix time format.

MSG #01 - Position

[Latitude] 32 bits
[Longitude] 32 bits
[Altitude] 16 bits

Example:

0B 01 06 81 F5 7C 5E BA C9 1D 65 01 = 34.959 N, 120.424 W, 257 meters

MSG #02 - Timestamp

[Time] 32 bits

Example:

05 02 6E 3E 38 3E = Wed, 29 Jan 2003 20:49:50 UTC

Position with timestamp example (18 bytes total):

0B 01 06 81 F5 7C 5E BA C9 1D 65 01 05 02 6E 3E 38 3E

Errata

16-bit unsigned altitudes may be a problem in areas like Death Valley.
Use of signed integers would limit altitudes to 32,767 meters max.
This could pose a problem for balloon experiments at high altitudes.

Updated notes to include new altitude format, plus course and speed and

comment messages: (Bob, you're unusually quiet. Comments?)

N1VG format working notes

Message Header Format

```
bits: 1      7      8      8
-----
| ext_flag | length | msg_type | ext_type | message body... |
-----
```

ext_flag - A '1' in this field indicates a 16-bit message ID.

length - Length of message, inclusive of message ID.

msg_type - The message ID if ext_flag = 0, otherwise the low byte of the message ID

ext_type - High byte of message ID. Only present if ext_flag = 1.

This message type scheme allows for 65,792 message types (256 standard and 65,536 extended).

8-bit message IDs are reserved for common, standard messages. 16-bit IDs are used for less-frequently used messages and experimental message types.

0-byte messages are supported for instances where the presence of the message type alone conveys the required information.

No CRC is included, as a reliable transport layer is assumed.

All numbers are little-endian. Signed integers use two's complement notation.

MSG #01 - Position

[Latitude] 32 bits

[Longitude] 32 bits

[Altitude] 24 bits

Positions reference the WGS84 datum using decimal degrees. Coordinates are represented by 32-bit unsigned integers as follows:

Integer longitude = (longitude + 180) * 2²³

Integer latitude = (latitude + 90) * 2²⁴

Altitude is in centimeters above WGS84 ellipsoid, stored as a 24-bit signed

integer.

Example:

0C 01 06 81 F5 7C 5E BA C9 1D 7C 47 00 (34.959 N, 120.424 W, 183.0 meters)

MSG #02 - Timestamp

[Time] 32 bits

Times are in seconds elapsed since 1 Jan 1970 00:00:00.0 UTC (UNIX format).

Example:

05 02 6E 3E 38 3E (Wed, 29 Jan 2003 20:49:50 UTC)

MSG #03 - Freeform Comment

[Text] Up to 126 characters, not zero-delimited

The purpose of the comment is to provide a free-form text field associated with the originating station.

Example:

05 03 41 42 43 44 (ABCD)

MSG #04 - Course and Speed

[Course] 16 bits (degrees)

[Speed] 16 bits (cm/sec)

Speeds are in centimeters per second. Course is in degrees relative to true north.

Example:

05 04 C3 00 AE 08 (195 degrees at 80 km/hr)

Hello Dale,

I talked to Hans-Juergen (DL5DI, sysop of db0lj) about port filtering some days ago and he gave me this info.

One thing I'm really missing in this filter implementation:

There's no filter by distance.

Is it planned to include it in future versions?

Is it also planned to make a standard (not to use the word 'spec') for filter commands and the syntax they could be send to the server?

Right now we have two syntaxes... :(

> Right now we have two syntaxes... :(

When I defined my syntax in javPRSFilter I was not aware of Dale's syntax and I can not recall that I have seen it somewhere before (I could be wrong). My design goal was to create simple and short command structure that will take as few keystrokes as possible but still provide a big variety of options and easy to remember. The current implementation provide 8 different types of filters.

An other thing is that my implementation is purly targeting on filtering based on the packets content and not how they are handled by the server or how they entered there. The later depend on how the server is designed and is actullay not possible to add in my code.

I had only the end users in my mind to see what they would like to have.

Server statistics and other server data is handled differently between servers and I think Dale's is a nice implementation for aprsd sysop and javAPRSSrvr have other solutions for it's sysop's to provide the same thing.

If Dale plan to add packet content based filtering I think it would be nice to create one syntax. Today we provide 2 different things. javAPRSFilter provide packet content filtering and Dale's OmniPort server processing information (at least what I understand)

As a couple people have suggested, I'm moving this discussion to the spec list. I may still seek input from the wider APRS community on specific issue. For review, here's my current version of the spec working notes. I hope it explains clearly enough what I'm trying to accomplish.

N1VG protocol working notes

Purpose

This document describes a proposed replacement for and/or adjunct to the existing APRS specification. The protocol described here allows for simple or complex messages to be built from a set of simple component message formats.

Message Groups

One or more message components forms a Message Group. A Message Group may be optionally prefixed with a sequence number. The sequence number allows receiving stations to identify the most recent data from the sender. In a peer-to-peer environment, stations may choose to store the most recent Message Group from each sender heard. Future extensions to the protocol will allow peer stations to exchange and synchronize information about neighboring stations.

Data Types and Units

All numeric data types are little-endian (low-byte first). Signed integers use two's complement notation. Single and double precision floating point numbers use IEEE Standard 754 format. Character values are standard ASCII. The protocol will use SI units exclusively.

Message Header Format

Every component message of the protocol is preceeded by a Message Header. This indicates the length and type of the following message. The length is provided even in fixed-length messages to allow simple clients to skip unsupported message types.

bits: 1	7	8	8	

ext_flag	length	msg_type	ext_type	message body...

ext_flag - A '1' in this field indicates a 16-bit message ID.

length - Length of message, inclusive of message ID.

msg_type - The message ID if ext_flag = 0, otherwise the low byte of the message ID

ext_type - High byte of message ID. Only present if ext_flag = 1.

This message type scheme allows for 65,792 message types (256 standard and 65,536 extended). 8-bit message IDs are reserved for common, standard messages. 16-bit IDs are used for less-frequently used messages, status flags, and experimental message types. 0-byte messages are supported for instances where the presence of the message type alone conveys the required information.

A length field of 0 (bytes 0x00 and 0x80) is reserved and currently undefined.

No CRC is included, as a reliable transport layer is assumed.

Message Format Definitions

MSG #00 - Message Group Sequence

[Sequence] 16 bits

The message group sequence optionally associates multiple message parts with a single sequence number. The sequence number starts at 1 and is incremented each time the originating station has new information to transmit. A message group may not contain more than one of the same message type unless otherwise noted. If a datagram-oriented transport is used, message groups may be split across datagrams, but each datagram must carry the Message Group Sequence message.

MSG #01 - Originating Station

[Callsign] 6 bytes

[SSID] 8 bits

[Sequence] 16 bits

[Network] 8 bits

This message type is intended to prefix messages which originated with other stations. Messages may be collected and grouped together for transmission by a digipeater using this mechanism, or it may be used to identify messages when carried over a backbone network. In the case of a stream-oriented transport such as TCP, all following messages are assumed to originate at the specified station until another Originating Station identification message is received. For datagram-oriented transports like unconnected AX.25 and UDP, the scope of the identification message extends only to the end of the underlying datagram.

A Message Group Sequence may follow an Originating Station message to indicate the start of a new message sequence. The callsign, SSID, and originating network values are carried over to the new message group. This may be used for transmitting a multiple-sequence history for a given station.

If the originating station did not provide a sequence number, the sequence field is set to null (ASCII 0).

Callsign - The originating station's callsign, right-padded with nulls (ASCII 0).

SSID - The SSID of the originating station.

Sequence - See Message Group Sequence. A sequence of 0 indicates no associated group.

Network - Identification of the originating network.

Currently defined network IDs:

00 - Primary VHF channel (144.39 in the US)

01 - APRS-IS backbone

02 - UHF backbone

03 - HF

Message groups lacking an Originating Station prefix are assumed to originate with the sender. The originating network is assumed to be that on which the message group was received.

MSG #02 - Path Trace

[Callsign] 6 bytes

[SSID] 8 bits

[Network] 8 bits

<repeated 0 or more times>

To request a path trace, a station may include an empty Path Trace message. Any station the message passes through should add its own callsign and SSID to the Path Trace message. A Path Trace may be added by any station along the path, whether the originating station requested it or not. The network ID indicates the network on which the station received the message.

Example:

01 05 (Request a path trace)

MSG #03 - Heard-By List

[Network] 8 bits
<repeated 0 or more times>

A station transmitting a message to another network must add the source network's ID to this list, if the source network is not the originating network of the message. This message type should only be present in message groups that have passed through a network gateway.

MSG #04 - Position

[Latitude] 32 bits
[Longitude] 32 bits
[Altitude] 24 bits

Positions reference the WGS84 datum using decimal degrees. Coordinates are represented by 32-bit unsigned integers as follows:

Integer longitude = (longitude + 180) * 2²³
Integer latitude = (latitude + 90) * 2²⁴

Altitude is in centimeters above WGS84 ellipsoid, stored as a 24-bit signed integer.

Example:

0C 01 06 81 F5 7C 5E BA C9 1D 7C 47 00 (34.959 N, 120.424 W, 183.0 meters)

MSG #05 - Timestamp

[Time] 32 bits

Times are in seconds elapsed since 1 Jan 1970 00:00:00.0 UTC (UNIX format).

Example:

05 02 6E 3E 38 3E (Wed, 29 Jan 2003 20:49:50 UTC)

MSG #06 - Freeform Comment

[Text] Up to 126 characters, not zero-delimited

The purpose of the comment is to provide a free-form text field associated with the originating station.

Example:

05 03 41 42 43 44 (ABCD)

MSG #07 - Course and Speed

[Course] 16 bits (degrees)

[Speed] 16 bits (cm/sec)

Speeds are in centimeters per second. Course is in degrees relative to true north.

Example:

05 04 C3 00 AE 08 (195 degrees at 80 km/hr)

MSG #08 - Networks Available

[Network] 8 bits

<repeated 0 or more times>

A station may use this message type to announce the Network IDs of the networks it is connected to and willing to pass traffic to or from.

MSG #0100 - Emergency

(No content defined)

Presence of this message indicates an emergency situation.

Example:

82 00 01

Extended message types 0x100 through 0x1ff are reserved for status flags.

MSG #xx - Satellite Keplerian element

[Sat ID] 24 bits (NORAD catalog number)
[Epoch time] 64 bits (double float)
[ndot] 32 bits - \dot{n} /2 drag parameter (single float)
[nndot] 32 bits - \ddot{n} double dot/6 drag parameter (single float)
[bstar] 32 bits - Bstar drag parameter (single float)
[elset] 16 bits - Element set number
[inclination] 32 bits - orbital inclination (single float)
[ra] 32 bits - Right ascension (single float)
[eccentricity] 32 bits - orbital eccentricity (single float)
[aop] 32 bits - argument of perigee (single float)
[ma] 32 bits - mean anomaly (single float)
[mm] 64 bits - mean motion (double float)
[rev] 16 bits - revolution number

All values are the same as those in standard NORAD TLEs, taking into account implied decimals and exponents.

Example Scenario:

Tracker X1AA -> VHF:

Position
Timestamp
Course/Speed
Trace Path

Tracker X2AB -> VHF:

Sequence 45
Position
Timestamp
Weather

Digipeater D1AA -> VHF:

Networks Available: 0 2
Originating Station X1AA Sequence 0 Network 0:
Position

Timestamp
Course/Speed
Trace Path: D1AA
Originating Station X2AB Sequence 45 Network 0:
Position
Timestamp
Weather

IGATE G1ATE -> APRS-IS:

Networks Available: 0 1
Originating Station D1AA Sequence 0 Network 0:
Networks Available: 0 2
Originating Station X1AA Sequence 0 Network 0:
Position
Timestamp
Course/Speed
Trace Path: D1AA(Net 0) G1ATE(Net 0)
Originating Station X2AB Sequence 45 Network 0:
Position
Timestamp
Weather

APRS-IS -> TCP Client:

Originating Station G1ATE Sequence 0 Network 1:
Networks Available: 0 1
Originating Station D1AA Sequence 0 Network 0:
Networks Available: 0 2
Originating Station X1AA Sequence 0 Network 0:
Position
Timestamp
Course/Speed
Trace Path: D1AA(Net 0) G1ATE(Net 0) <APRS-IS server>(Net 1)
Originating Station X2AB Sequence 45 Network 0:
Position
Timestamp
Weather

Thanks Brent and the rest of you who answered my questions. I just
added method #1 (logon string) into Xastir CVS. It's working great,
settable per internet server in the properties dialog for that
server.

The Winter, 2003 issue of TAPR's journal, The Packet Status Register, is
available online at <http://www.tappr.org/PSR>.

Its contents include:

- * New 802.11 E-List
- * TAPR Project Policy
- * OneTech π02 Technical Symposium
- * Book Review: 802.11 Wireless Networks
- * 3D Environments and Mars: A Follow-up from the 2002 DCC
- * Extending Icom OPC-581 Extension Cables for Icom IC-706s
- * Digital Radio Mondiale and Amateur Radio Implications
- * 2003 in Connecticut

Enjoy!

73,
John

cc:ing this to the APRSpec list to migrate it there...

> I agree. The small advantage of Binary is more than offset by dozens of
> reasons to stick with printable ascii. BOB, WB4APR

I suppose it all depends on what the excersise is trying to accomplish.

If it's simply binary-encoding the existing spec, then then I agree.

>From what I'm reading, though...this newly emerging protocol will include:
o finer detail (smaller stept) than what is available in the
existing protocol

o new parameters that the existing protocol doesn't address

That being said, this new protocol work appears to have more advantage than what may appear on the surface.

Of course, my opinion and 99-cents gets you a Big-Gulp at the corner mini-market.

Regards,
Ev, W2EV

Can someone fill me in on the real-world use of the DF reporting formats?
Some things that bug me in the spec:

'N'umber is defined, but not processed. Does anyone use this? Does it mean anything?

'R'ange doesn't seem to make much sense for a tracking device that's not connected to a map display. This value has no direct relationship to the signal, right?

I'd assume 'Q'uality would usually be a fixed value to indicate the beamwidth of the antenna.

Omni signal strength at least makes sense. How much is this used, and what hardware are people using to do it?

Yeah, this is more a real-world question than a spec question, but if someone here can answer it it'd spare the SIG more of my rambling. =]

Thanks...

Scott / N1VG

It is very important. An HF BEAM can detect a signal coming in from 3000 miles away. Thus, his bearing line should be 3000 miles long. A double-ducky handheld VHF DF unit can get a bearing on a signal maybe 20 miles away if he is on a hill. Thus a 20 mile bearing line is appropriate. Once he is in close, the signal is strong, and his DFING has revealed that he is within about a mile of the source, then a 1 mile DF line is appropriate.

Some APRS client programs do not use this data, and their use in actual DF work is almost useless because they do not display the ORIGINATORS knowledge of how far OUT his bearing line is of value...

> I'd assume 'Q'uality would usually be a fixed value to indicate the
> beamwidth of the antenna.

Yes, You could use it to display various width wedges. In APRSDOS, I did not do wedges because it just confused the display (since I could not shade it in in DOS) so I just made the bearing line more or less "dotted" to show the quality of the fix...

> Omni signal strength at least makes sense. How much is this used, and what
> hardware are people using to do it?

Yes be sure to see <http://www.ew.usna.edu/~bruninga/dfing.html>

Has anyone ever looked at the feasibility of using a digital signature algorithm for authentication in APRS or packet in general? My concern is mostly with object and item reports - if I mark a crash site or victim location on a map, I don't necessarily want someone to be able to move it. A real public-key infrastructure would be difficult to implement, I think, but it seems to me that you ought to at least be able to ensure that the creator of an object is the only one who can change it, if that's what they want. Elliptic Curve Digital Signature Algorithm seems like an ideal algorithm for implementing this. You could put your public key in the initial transmission, and subsequent transmissions would be verifiably from the same source. A 160-bit ECC key is roughly equivalent to a 1024-bit RSA key, and 108 bits is the longest ECC key that's been cracked so far. 128 bits (16 bytes) would seem more than sufficient for amateur purposes.

Now, before anyone has a fit about cryptography in amateur radio, keep in mind that this DOES NOT CONCEAL THE MEANING of a message. It only serves to verify that two or more messages came from the same source.

Thoughts, anyone?

I've created a new mailing list dedicated to discussion and development of the new (as yet unnamed) binary protocol. To subscribe, send a message to lists@n1vg.net with the subject line 'subscribe spec'.

I've had lots of good feedback on the APRS SIGs about this project, but I don't want to clutter up the lists with lots of technical discussions that aren't strictly about APRS. I'd like to encourage anyone who's interested in contributing to the protocol, or who just wants to lurk and see what's going on, to join the list.]

For anyone who's missed the previous discussions about the proposed protocol, I'll be setting up a website soon with a summary of the project's goals, as well as the current version of the spec.

I've had a couple of people say 'but it's not APRS'. I'd rather just avoid the whole issue and keep it separate. I'm sure I'll still be posting periodic updates here, and I'll also be on the main APRS SIG asking for input from the wider APRS community from time to time.

Scott / N1VG

Roger asked: "Is there a reason why it shouldn't be discussed in this list?
I don't want to join yet another list."

Scott said: "I've had a couple of people say 'but it's not APRS'. I'd
rather just avoid the whole issue and keep it separate."

Interestingly...I support both Roger's desire to keep life simple, as well as
the frustration that Scott must feel when trying to take something to a new
level and be met with such narrow vision.

Scott, what you are developing will, potentially, have a positive impact on several UI-Frame services...however...without buy-in by the APRS community, the chances of adoption of the protocol will be slim as APRS is still the "800-pound gorilla" of UI-Frame AX.25.

I will go wherever the discussion goes...but would offer the insight that -- by leaving it here -- you can keep the APRS community actively engaged in it's development and may see that it is more quickly accepted by APRS authors once it matures.

This list really isn't that busy anyway. :o)

fwiw.

Warm regards,

Ev, W2EV

I share the views of many others in that this list is EXACTLY the right place to discuss any issues with SPEC development. And since there has not been too much traffic on this list recently, I don't think that the other members will have too many problems with this.

The risk with running another mailing list is that many people who would normally be reading the traffic will not see the posts as they go past.

There are no issues with creating another TAPR list, all you have to do is ask.

Darryl,
TAPR board member

Darryl:

I don't share those views.

This list (APRSSPEC) was specifically created to support the APRS-WG committee. After the APRS-WG was created, they documented the existing format. Over two years since then, and nothing.

The new list may fail, but at least give them every chance they can. I'd rather see a new list, be it Scott's or TAPR's. Then the people joining it are sincerely interested in progress. Change happens with just a few people, not a committee.

G'Day

I am sorry for the cross-post, but sometimes this is needed. For those that are not aware of it, [since they feel that they should get their APRS news from the APRS SIG and not from SlashDot.Org], there is a group producing a protocol called the OPENTRAC. Their WWW site is www.opentrac.org. Apart from the email address scott@opentrac.org I have no idea who is involved with this project.

I am going to email scott and find out more. However I am rather concerned about the fact that the first thing I heard about this spec was on SlashDot and not on APRSsig or APRSpec.

I am concerned that the unity we achieved by producing the working document will be destroyed by producing another spec, no matter how good.

<DIV>Dear Friend,

I am MR ABIOLA GEORGE, Bank Manager of ORIENT BANK OF
NIGERIA, Lagos
Branch. I
have urgent and very confidential business
proposition for you. On
June 6
1997, an American oil consultant/contractor
with the Nigerian National

Petroleum Corporation, Mr. Nelly Cole made a
numbered time (Fixed)
deposited for twelve calendar months, valued at
US\$25,000,000.00
(TWENTY FIVE Million United States Dollars) in my
branch.
Upon
maturity, I sent a routine
notification to his forwarding address but
got no reply. After a
month, we
sent a reminder and finally we discovered
from his contract employers,

Nigerian National Petroleum Corporation that
Mr. Nelly Cole died
from an
automobile accident. On further investigation,
I found out that he
did not
leave a WILL and all attempts to trace his
next of kin were
fruitless. I
therefore made further investigation and
discovered that Mr. Nelly Co

le did
not declare any next of kin n all his official documents, including

his Bank
Deposit paperwork. This sum of US\$25,000,000.00 is still sitting
in
the Bank
and the interest is being rolled over with the principal sum
at the
end of
each year. No one will come forward to claim it. According
to the
Nigerian
Law, at the expiration of 6 (six) years, the money will
revert to the

ownership of the Nigerian Government if nobody applies to
claim the
funds.
Consequently, my proposal is that I will like you as a
foreigner to
stand in
as the next of kin to Mr. Nelly Cole so that the
fruits of this old
man's
labor will not get into the hands of some corrupt
officials. This is
simple
I will like you to provide me immediately with
your full names and
address
so that the attorney will prepare the
necessary documents and
affidavits,
which will put you in place as the
next of kin. We shall employ th

e
services
of two attorneys for drafting and notarization of the WILL and
obtain
the
necessary documents and letter of probate/administration in
your
favor the
transfer. A bank account in any part of the world, which
you provide,
will
then facilitate the transfer of this money to you as the

beneficiary/next of
kin. The money will be paid into your account for us
to share in the
ratio
of that we will both agreed upon. There is no risk
at all as all the
paperwork
for this transaction will be done by the
attorney and my position as
the
Branch Manager guarantees the successful
execution of this
transaction. If
you are interested, please reply
immediately via email. Upon your
response,
I shall then provide you with
more details and relevant documents
that will
help you understand. Please
observe utmost confidentiality, and rest
assured
that this transaction
would be most profitable for

both of us because
I shall require your assistance to invest my share in
your country.
Awaiting your urgent reply via email:

Best regards,

Abiola George. </DIV></TD></TR></TBODY></TABLE></div></TD></TR></TABLE>

(Sent on behalf of Darryl, VK2TDS, TAPR Membership Director -- <mailto:vk2tds@tapr.org>)

People

TAPR Membership

Running TAPR takes resources, and as a non-profit organisation we rely on members for part of our funding. If you support the work that TAPR is doing, we would welcome your membership of the organisation. You can join by clicking on <http://www.tapr.org/tapr/html/orgf.html> . We have also been listening to members requesting that we support electronic commerce. TAPR are currently testing the use of PayPal in association with the current ordering system on the Web. We will post a message on the WWW site as soon as this is available.

Until then you can still join. Just fill out the electronic form as normal, and state in the comments that you want to pay with PayPal when it is available.

Digital Communications Conference

This years DCC will take place at the Hartford/Windsor Marriott Airport Hotel in Windsor, Connecticut, on the weekend of September 19-21, 2003. The hotel is 6 miles south of Bradley International Airport (BDL) and 13 miles north of ARRL Headquarters in Newington. Information will soon be available on <http://www.tapr.org/tapr/html/conff.html>. Until then you can find more information in the PSR at ftp://ftp.tapr.org/psr/Winter_86_2003.pdf

We will soon be issueing a call for papers for this event. Have a think about what you want to write about and start planning your paper now. If you are unable to come up with a subject, it is often possible to find friends with something to write about, but who don't have the time. You can help your friend and the Ham community by writing the paper on their behalf. There will be two popular discussion points at the conference - Software Defined Radios and 802.11 networks.

DCC Conference Proceedings

We have also reduced the price of each of the proceedings of the DCC up until 1997 to only US\$6 each. This makes the a real bargain. We are also making available sets of volume 1-10 and 11-16 available for \$US\$33 each - but please bear in mind that we no longer have copies of a number of the proceedings so we cannot guarenttee that the sets will be complete.

Electronic Distribution of Packet Status Register (PSR) Magazine

Listening to members we have found that many people are concerned about missing out on the PSR now that it has gone electronic. We recognise this as an issue, and we have come up with a solution to make things a bit easier in this digital age. We have created two mailing lists to assist you with keeping up to date with the quarterly magazine. They are

PSR-Announce
PSR-PDF

PSR-Announce is designed to advise the availability of the PDF file for download. We recognise that many people are on slow internet connections at home, or in fact have to pay for their bandwidth. So we have created a mailing list just to tell you when the magazine comes out, and to let you know how to get it. You can subscribe by visiting http://www.tapr.org/cgi-bin/lyris.pl?enter=psr-announce&text_mode=0

PSR-PDF is designed for people who have a faster internet connection, or

who know that they will never get to read it unless it is sent directly to them. Since PSR often contains graphics, the file can be over one mByte. You can subscribe by clicking
http://www.tapr.org/cgi-bin/lyris.pl?enter=psr-pdf&text_mode=0

802.11 Mailing List

Whilst we are on the subject of mailing list, TAPR have started a mailing list for 802.11 'Wireless Internet' operations. It seems that every community has a mailing list dedicated to 802.11. So how is the TAPR one different? It is dedicated to 802.11 use in ham radio. The list contains active members of the entire range of technical ability - from the most basic understanding of how radio works, to the deep internals of this equipment. Such a broad range that everyone is sure to fit in. You can join by visting
http://www.tapr.org/cgi-bin/lyris.pl?enter=ham-80211&text_mode=0

GNUradio receives HDTV

Matt Etus and the other people at the GNUradio project have announced that they have managed to decode the HDTV data stream on their PC's and have published the source code online. This is an amazing feat by Matt and the team. They are not quite to the stage of real time HDTV decoding on a PC, but are close.

Write for PSR!!!

PSR needs articles, and we would love to publish lots more in the PSR magazine. PSR is a great place to publish articles on everything from local operating practices to deep technical papers. And since the last issue TAPR is now rewarding those people who are helping others by writing articles for the magazine. Following the last issue, six people had their memberships extended by three months. This is just a small thank you from us at TAPR to those people who help us out. More details on PSR can be found on www.tapr.org

Conclusion

I hope you have found this document informative and useful. TAPR is always looking for new things to do and how to improve what it is already doing. If you have any ideas or concerns, please email me on darryl@radio-active.net.au

Darryl

Can UDD begin anywhere in the comment field, or must the comment field begin with a "{"? I can't seem to find the information on this in the spec.

ie- Is this valid: "[FM29AC]{{XABCDEFGHIJKL"

Also...what UDD's have been assigned already?

Ev, W2EV

Hi Ev

I believe that the { has to be the first character of the UI
frame data payload. The { is an APRS data type identifier. Just like
the @ has to be the first character.

At least I hope that the above is correct or we in the APRS phrasing
world would have yet another "special" case to handel.

To my knowledge the ! character is the only APRS data type
identifier that can be any where up to the 40 th character in the
payload. Net node stations have a portion of their beacon text that
can not be changed by their sysop. So the ! ends up at the end of
their "canned" beacon text.

It is in there, though perhaps you are not familiar with the terms:

The data in the AX.25 Information field consists of a three-character header:
{ APRS Data Type Identifier.
U A one-character User ID.
X A one-character user-defined packet type.

By definition, the APRS type identifier must be the first character of the
payload.

>ie- Is this valid: "[FM29AC]{{XABCDEFGHIJKL"

>

>Also...what UDD's have been assigned already?

I don't think any have officially been assigned, if I'm wrong, perhaps Bob can
post a list. I know at least one person has claimed to have tried to get one
registered and when that failed just began using what he wanted.

Thanks for the help, Steve and John. It appears that, when the spec says, "consists of a three-character header", the inference is that it is a header to the AX.25 comment-field field (like ">") as opposed to a header to a comment-field embedded UDD Field (like PHG). Not having the pleasure of having to write a parser for others, I had no experience against which to draw to get to the right conclusion.

I appreciate your clarification, guys. Thank you.

So...on to a task at hand (one that seems to elude me like a mirage as it is approached)...

Can anyone think of how I can preserve the Grid-in-Comment posit along with carrying User Defined Data? An example that works in UI-VIEW is shown below, but it apparently violates the spec on UDD:

W2EV-10>CQ,FLOOD,HOP2-2,RFONLY:>FN03XDH#{Yzabcdefghijklmnopkl

Ev, W2EV

PS - I'm looking for the ability to launch a frame that conforms to the APRS spec, but that will also fit the needs of the BEACONet community:

- o as short as possible (this is top priority)
- o use of 6-character gridsquare
- o ability to be treated as an ALTNET 100% of the time by APRS stations
- o able to encode UDD in the form of a BEACONet Configuration Code (a more robust PHG system)

Actually, there is nothing wrong with this, anything that comes after the grid is up to the user. The difference is that none of the tools written for user defined format will work on this. Of course, those tools are few and far between now, findU does parse them into a table, but does nothing with it as of yet.

Just to be clear...it appears that what I'm suggesting does not follow the APRS
spec, yet is a "special case" that would cause no problems if used. The big
question is: Bob? Do you agree that this is allowed and should be supported?

Nothing happens in the world of APRS without your official blessing. :o)

Ev, W2EV

Hi Bob,

I hadn't seen your reply to this on the APRSspec list, though you haven't commented on the APRS list either so may be a bit distracted with the events of the world around us these days. When you have a moment to consider the info below, would you mind commenting on it? It's in chronological order, top-to-bottom for an easier read.

It isn't necessarily a direction that I want to pursue yet (it still adds 5

bytes [some 15% or so] of useless info, but it's a start), but before I knock myself out considering it seriously, I thought I'd ask.

The two affected frames are shown below, as an fyi:

W2EV-10>CQ, FLOOD, HOP2-2, RFONLY:>FN03XDH#f{YZabcdefg

W2EV-10>CQ:>FN03XDH#f{YZabcdefg^ABCD

Regards,

Ev Tupis, W2EV

Just to be clear...it appears that what I'm suggesting does not follow the APRS spec, yet is a "special case" that would cause no problems if used. The big question is: Bob? Do you agree that this is allowed and should be supported? Nothing happens in the world of APRS without your official blessing. :o)

Ev, W2EV

Was in Orlando for 24 hours with ARISS team tring to define D7600 for
ARISS on ISS and have to deliver PCSAT 2 in 2 weeks. WOrkign every
minute of day on deadlines...

But anything in the coment field after the Grid square is OK and will not break anything. Then all you have to do is convince other authors to decode it if they want...

People

I have a copy of the 1.0 spec (and this could have changed but I doubt it) and one of the recommended decoded APRS strings is \$GPWPT. I would like to suggest that this is removed from the recommendations on the last page of chapter 6. I have ****NEVER**** seed this packet sent on air...

Darryl

GPWPT is can be sent to a GPS receiver to create a waypoint, and thus a display of APRS positions. I suspect it is not often on the air, true. But it is used by the Kenwood D7/D700 and other programs in APRS. Brent KH2Z

Xastir uses "GPWPL". No "GPWPT" listed in the sources.

There is a very important reason for that to be in there. It is so you
can send POSITION data to anyone with only a TNC and GPS! It lets
a TRACKER built from just a TNC and GPS to display POSITION data
(sent in Waypoint format) to be displayed on the GPS map. Thus, you can
send POSIT data to Search teams or anyone using their GPS as the display.

There are many many features in APRS that "most people" never use and not
seeing them on the air, does not make them any less valuable... to the

person that does need it...

Ah, are we talking a typo here in the spec?

I am not saying that it would not be useful, but I would not suggest that this is a sentence that ****SHOULD**** be implemented in all software.

With my AntiTracker you can do the same thing, decoding normal APRS off air and sending it to a GPS receiver... But that is more hardware.

Darryl

No this is NOT a typo or a mistake.

Curt said that Xastir recognizes GPWPL which is ALSO a valid NEMA sentence. GPWPT is a separate sentence.

GPWPT is sent TO the GPS to display a waypoint

GPWPL is sent from the GPS, It is the DESTINATION that the GPS is currently going TO. For example, in my recent trip to Flordia, I would get the following every second

\$GPWPL,2830.242,N,08122.380,W,ORLANDO*03

This says that the GPS is currently in GOTO ORLANDO mode.

While GPWPT and GPWPL are related, they actually have entirely different meanings.

Actually I said (thought I said?) that Xastir sends the "GPWPL"
sentence _to_ a Garmin GPS in order to create a waypoint. Perhaps
we're doing something slightly different than intended? It works
though! We get waypoints created on the Garmin as we drive along,
just like a few other programs and the Kenwoods can do.

I'll have to get back into the specs again to read up on these two
sentences. GPWPT is one I haven't seen/used before. Doing a google
search shows only two hits for GPWPT, but many for GPWPL.

And another site which shows that the GPS outputs this sentence as
well, so it looks like a dual-use sentence:

<http://home.mira.net/~gnb/gps/nmea.html>

I think that there is a more fundamental issue here that I have uncovered. It is to determine a priority for decoding APRS... Basically what I see is that we could have a few different implementation types, because like it or not, not every author implements everything...

I know that many authors do not implement base-91 compressed. Others do not do GPWPL. Some do not do every \$GP sentence apart from \$GPWPL.

Right now APRS authors **SHOULD** implement base-91 compressed, and **SHOULD** implement GPWPL. Whilst these types are nice, they are not used very often, and at are often not worth the hassle of implementing. I know that in my AntiTracker decoder, built into a PIC, that I did not have space to implement either of these.

I think that we need to give some guidance to authors about what features are more critical than others, since I suspect that there is only one piece of software out there that implements the lot.

I really think the bloat added to the spec by features like this that are only used by 0.1% of the population is really not worth the small benefit it gives. Personally, I don't think we should be putting ANY NMEA sentences on the air. That was understandable when APRS was new and there wasn't much support for it. But with TinyTraks and Darryl's AntiTracker, there's not much point.

<obligatory plug>

The (still in-work) OpenTRAC protocol specifies exactly one position format. Like every other element, it's tagged, so you can extract it whether you understand any of the other elements or not. And the position format happens to be directly compatible with the Garmin 'semicircles' format, so an AntiTracker-type device connected to an eTrex, for example, wouldn't even need to translate the position.

</obligatory plug>

Scott

I know that in my AntiTracker decoder, built into a PIC, that I did not have space to implement either of these.

I think that we need to give some guidance to authors about what features are more critical than others, since I suspect that there is only one piece of software out there that implements the lot.

But if stations are using WAYPOINT format to send OBJECTS in your event, it is essential that ALL participating stations see the same thing. THUS all APRS stations are expected to decode the WAYPOINT format as an object and place it on the map.

TO not implement it means an incomplete APRS implementation that destroys the integrity of the standardization of APRS.

Bob

Being one of the authors, I think I can address some of these issues.

Accepting \$GPWPL from a GPS in a program is kind of useless if that program does have anything to do with it. A value from \$GPWPL is a waypoint, not a station as APRS has for one of its main constructs. Therefore if a given program does not have any features to handle a "waypoint", then decoding \$GPWPL is kind of pointless.

Now it so happens that waypoints is one of the things I am currently working on in WinAPRS so this IS something that I intend to address.

As you stated, different authors do different things, what is CRITICAL to one user may be useless to another. Being an author, if I don't get requests for a particular feature, it gets ignored.

Mark

Thanks for offering me a stump! hi hi:

In my opinion, there is only one answer. APRS is a communications system. It is for emergencies, and come as you are communications. It MUST be fully implemented in EVERY implementation if there is any hope of actually "communicating" across platforms... OR each omission must be clearly identified so that users know what they "cant see"...

This is why I wanted to "license" authors. To make sure that "APRS" would work. But now we have a tower of Babbble, The only way I can be sure that someone sees my DF bearings, My AREA Contours, My Waypoints, My ICON Overlays, My Moving WEATEHER objects, my DX cluster spots or RESOURCES, or Highway Mile marks or just about anything else correctly is to have the other person use APRSdos.

But we all know that APRSdos maps are obsolete.. Thus we have many other excellent progrms that have been written. But some authors only wrote the part of APRS that looked "pretty". And ignored many of the hard or "rarely used" functions..

Of course, the RARELY USED features are very powerful when they are used for what they were intended. And just because you do not have a conflaguration or 911 in ones county every day which demands reliable, digital communications with INTEGRITY, does not mean that any given function is not "important".

Now, it is OK to omit functions, because there are 30,000 lines of code in APRSdos and no one can implement all of APRS overnight. So APRS programs evolve... But EVERY PROGRAM THAT DOES NOT IMPLEMENT FEATURES MUST MAKE A LIST OF SUCH OMISSIONS so that its users know what they CANNOT SEE...

Again, I am not faulting anyone. I would be happy if authors simply displayed a WARNING whenever they received an APRS format that is in the SPEC but that is not implemented instead of just ignoring it. That way the user can do what he needs to get the information via other means, but we cannot just ignore parts of the spec...

Again, we need to display to users UP-FRONT and at every instance what is not yet implemented, this is the only way to keep the users informed of what they can and cannot do cross-platform when they need it. And it lets them know what they are not seeing...

Thanks
Bob

It is this attitude which has destroyed APRS and has made cross platform communications almost useless in a REAL communications scenario. APRS was designed for REAL-TIME EMERGENCY, and PRIORITY communications.

IT WAS NOT DESIGNED FOR 24/7 round the clock monitoring of a useless overloaded congested channel with NOTHING of interest going on. I agree 99.9% of what you see on APRS is NOTHING to do with what APRS is designed to do!

Taking this attitude, do you take out all the fire alarms in the building because no one ever uses them? Do you remove the ability to dial 911 from your phone system because a few people use it wrongly? Do you take all the memory channels out of your radio except 146.52 and your favorite repeater because you only use them 99% of the time and only use the other 1% of the time?

How about taking the jack and spare tire out of your trunk? When was the last time you used that? Let see. About 10 miles out of every 10,000. Yep, thats less than 0.1%. Must be useless right?

The 0.1% features that you say are bloat are because only 0.1% of the population is using APRS for what it was designed to be used for. This is NOT their fault at all. We hope that we dont have emergencies and disasters all the time, but we need to use it 24/7 and BE FAMILIAR WITH ALL ITS FEATURES so that we can use it when we need it that 0.1% of the time...

Geeze, Throwing out what the "majority" never uses is the best way to guarantee that you will have a system that cant do anything else. APRS is not just a flashy video game...

It certainly does. A waypoint is an object on a map. I can think of
no more of a fundamntl constuct for ARPS than its OBJECTS. It takes
only a few lines of code to parse a \$GPWPL into an OBJECT. Why cripple a
program and cross platform users by leaving out such a fundamental
aspect of APRS...?

<MyOpinion>

</MyOpinion>

1) Ask on the APRSSIG mailing list for someone who's familiar with software testing and you may get a bite. Perhaps they can coordinate a group of testers to test for spec conformance, and publish a report on a regular basis. Seems like you might just find a body to fill that slot. The more people that see the conformance results the better of we'll all be.

Just some ideas...

People

I am looking for powerpoint files to create an improved indexing of PowerPoint files on TAPR.ORG. I have found some presentations, but I know that there are a LOT more out there. I would like to get as many powerpoint files on TAPR.ORG as possible and indexed.

If you have any powerpoint files that you would like to contribute to the TAPR.ORG archive, please send me an email at VK2TDS@TAPR.ORG and I will let you know where you can send the file. The files that I need are anything to do with amateur radio digital communications. This would

include

- DCC Presentations (I have most of 2002 seperately)
- APRS and GPS
- Digital Voice
- Emergency Digital Operations
- Spread Spectrum and 802.11
- etc

The only powerpoints I know of are listed below...

Thanks.... Darryl VK2TDS

Question for the group... Does anyone know if there is a place in the
weather data format to put water temperature?

73s,
Eric KF40TN

I'm glad its not just us in the UK that are forever having debates regarding datums.

It seems to me that there should be a facility in the APRS spec to be able to define the datum in use.

The spec states that the default datum is WGS84 but does not provide a means of specifying what the datum is, if the default is not used. This is especially important in areas such as the UK where virtually all maps available are to a datum other than WGS84.

I have to agree. The majority of my maps are in polyconic Albers equal area projection - the standard for the state of California. I think it's a lot more reasonable to either provide a reprojection facility, or require that the user reprojects the maps before use, than to have every client support a thousand different data ('data' being the proper plural of 'datum') and who knows how many different projections.

It would seem that if the APRS spec says that WGS84 is the datum of APRS (not just the default, but the only), then it's put squarely upon the shoulders

of
the client program authors to ensure that any maps it reads in are
re-projected or otherwise corrected into WGS84, or that any data it gets
from
the APRS system (RF or IS) is translated to whatever datum the map display
is
using.

Unfortunately, these dealing with datums and re-projection is tough stuff,
and
if you're just making some program to draw stations on maps, one may not dig
deep enough to even know that there are these things called 'datums'.

So theoretically, everything on the 'public' side of APRS (RF and IS) should
be WGS84, and anything internal to the client program can be whatever the
author (or user) chooses, so long as it stays internal.

More practically, Bob B. might say that the original design of APRS was for
local tactical something-or-other. If it's local, and everyone uses the same
setup (software, maps, etc.) then it may not matter (much), so long as you
can see the relative positions of everyone involved in your 'tactical
event'.

I think you've missed the point. I don't think the original question related to maps being "read in" to APRS client programs.

Try this -

Imagine a tactical exercise with the public services in the UK. A variety of APRS equipment is being used, from sophisticated client programs down to TH-D7s. The one thing you can guarantee is that every single paper map being used by the public services will be based on OSGB-36, not on WGS-84.

In that situation, do you really think the APRS users should be using WGS-84? So someone stands there with his TH-D7, receives the position of an ambulance object based on WGS-84, and then presumably has to get out his pocket computer to try and transform the location to OSGB-36, so the ambulance controller can reference the location to his paper map? That wouldn't be too impressive, would it?

Of course the only sensible thing to do in such a situation is to use OSGB-36 on APRS, and it is an obvious omission from the APRS spec that there is no designated way of stating the datum being used.

What datum is being used on the air in the UK?

Do your GPS receivers default to WGS-84? Do you reprogram
your GPS receivers to use OSGB-36?

Are you suggesting that OSGB-36 be used on the air in the UK,
or that APRS clients translate between on-the-air WGS-84 to
on-the-screen OSGB-36?

I thought I had explained my point very clearly... Read it again, and then tell me whether, in the situation I described, the use of OSGB-36 on APRS is sensible.

Think of what I described - the lowest level - the ham with the TH-D7 receiving posits that have to be related to a paper map being used by the public services, and that paper map will be based on OSGB-36.

That is the on-air format. Authors are may convert to other
internal datums for display. But the on-air values must be WGS84 for
compatibility.

>

Anyone that has to interface with a system that uses the UK national mapping standard (which includes paper maps) will have re-programmed their GPS to OSGB-36.

Those that like to see themselves on findu in the correct place will use WGS-84.

Others don't know what a datum is :-)

> Are you suggesting that OSGB-36 be used on the air in the UK,
> or that APRS clients translate between on-the-air WGS-84 to
> on-the-screen OSGB-36?

The suggestion is that there should be a mechanism to be able the datum in use to be transmitted.

One way is to put it in the UNPROTO TOCALL instead of the software version. This can even be done in the Kenwoods using the UNPROTO menu. But then we loose software version. Would it make sense to use the OSGB-36 everywhere in the country by default and use WGS84 by exception?

I don t konw.

Or send out a BULLETIN at any event saying what datum is in use.?
Ideas?

Bob

Bob,

The trouble is that WGS84 is not a suitable format for many situations. Virtually all our user service systems and paper maps in the UK use OSGB36 not WGS84.

It is not practical to take a co-ordinate from APRS in WGS84 and then use a calculator to translate it to OSGB36 so that is usable by the services we work with.

The spec does not say that WGS84 must be used on-air, it says the default is WGS84.

What I (and many others) want is a legitimate way of specifying, over the air, that we are using a datum that is different from the default.

The bottom line is that if a mechanism is not provided in the spec, then the spec will just be ignored, as the final aim is to pass useful data. In many circumstances that can only be done by sending OSGB36 over the air.

Laurie,

The issue is that with a single standard datum (WGS84) only map display programs need to do datum conversions. But, if multiple datums were transmitted over the air, each receiver would be required to do datum conversion. In the case of a D7, D700, HamHud or pretty much anything that isn't running a full blown PC or workstation, those calculations would not be possible. Doing a datum conversion requires a database of elipsoids (and other stuff, I'm sure) and a bunch of floating point calculations.

The sensible thing to do in the UK is to use OSGB-36, because that is the datum used for all our paper maps. I really only joined in this discussion because of the comment someone made that WGS-84 was the only datum that should be used on air. Here that makes no sense!

To identify the datum being used, and give clients the option of applying a transformation, one possibility is to put the datum in the posit comment, e.g. -

/D=OSGB36

Clients that understand it can use it, other apps will ignore it.

Some thoughts:

- 1) Shifting to regional default interpretation of APRS data (in general) opens a whole new area of administration / potential confusion. Well, the potential confusion appears to already be there, and recognizing it probably won't make it a lot better.
- 2) The problem with interpreting a coordinate in the wrong datum is that you won't get the correct absolute location. That's probably worse than no location report at all.
- 3) Separately transmitting the datum in use could easily lead to a case where some stations use one datum and other stations use another, and it becomes necessary to keep track of which datum a station has advertised.
- 4) Separately transmitting the datum means that a station could send position reports for 15, 30 or more minutes before anyone knows which datum the reports are in. See #2 above.

Personally, I think the ongoing desire to make APRS an extensible system is really a strong pressue to adopt an extensible representation. For example, there are tens of millions of wbXML devices in use, perhaps we should be thinking of how to evolve to something based on wbXML where data items can be explicitly typed when sent.

This whole thing has been brought up once or twice before, but

perhaps it'll get more airtime this go-around.

The example given of OSGB36 paper maps is an interesting one. We have a similar setup in SAR where most paper maps are NAD27 datum, but the APRS datum and the datum chosen by our SAR group is WGS84. People in the field sometimes switch between NAD27 (paper maps) and WGS84 (voice comms) while on their mission, depending on the accuracy they need at the time and whether we're bugging them for their position over comms.

For our county-sized area, we could use fixed offsets to the lat/long and have enough accuracy for our work, but that might not be the case for other datums or other areas. Fixed offsets could be done by low-end processors without getting into ellipsoid tables or floating point calculations, but again, that might not work in the general case.

The choice of datum for an affected area would depend greatly on who you have to work with at the time. Having the choice of on-the-air datum (and broadcasting that choice with the packet) and the choice of the on-screen datum would be ideal.

Those with less than full APRS mapping computers would need to assume that everyone is using the default datum for the event and do no conversions at all.

Those with computer mapping systems could have the computer convert the positions to the chosen display datum as they are received, so that any positions read off the display are instantly usable by other public agencies involved.

One thing on the Xastir todo list is to convert any GPS data from a local GPS into WGS84 before that data is used, so that it matches APRS standard datum. It sounds like we may want to have that an optional feature so that people can deviate from that datum if required.

Garmin GPS's put out different data on their serial lines based on the display datum selected, which I believe was an unknown "feature" at the time the APRS spec was written. It was believed that the NMEA data stream always used WGS84 data in all cases. That changed with Garmin, perhaps others.

The OpenTRAC protocol (<http://www.opentrac.org>) is pretty close to what you're describing. I've made the choice in the protocol specification to allow only WGS84, though. My feeling is that if you're going to be plotting coordinates by hand on a non-WGS84 map, using a receiving device that's not capable of translating the coordinates, you can go get yourself some transparency sheets and print up a WGS84 grid to overlay on your paper maps.

Some thoughts:

- 1) Shifting to regional default interpretation of APRS data (in general) opens a whole new area of administration / potential confusion. Well, the potential confusion appears to already be there, and recognizing it probably won't make it a lot better.
- 2) The problem with interpreting a coordinate in the wrong datum is that you won't get the correct absolute location. That's probably worse than no location report at all.
- 3) Separately transmitting the datum in use could easily lead to a case where some stations use one datum and other stations use another, and it becomes necessary to keep track of which datum a station has advertised.
- 4) Separately transmitting the datum means that a station could send position reports for 15, 30 or more minutes before anyone knows which datum the reports are in. See #2 above.

Personally, I think the ongoing desire to make APRS an extensible system is really a strong pressue to adopt an extensible representation. For example, there are tens of millions of wbXML devices in use, perhaps we should be thinking of how to evolve to something based on wbXML where data items can be explicitly typed when sent.

Jim,

With only WGS84 on-air it is not only map display programs that need to do

datum conversions.

Anyone trying to find the position on one of our paper maps would have to do it as none of them use WGS84

> In the case of a D7, D700, HamHud or pretty
> much anything that isn't running a full blown PC or workstation,
> those calculations would not be possible.

I wouldn't expect a D7 or D700 to do any datum conversion. I would expect it to display the posit it had received as is.

However, future radios (when a suitable method for sending the datum had been agreed) would in addition be able to display the datum that had been used.

That really is not practical.

If you were working with a public service in an emergency situation, would you seriously expect them to overlay their paper maps, which use the standard datum for the area, with a WGS-84 grid, just because a few radio hams insisted on using a datum different to the standard for the area?

You have to take a realistic approach to this, and the only possible realistic approach is that, in an emergency situation, it has to be possible to relate local posits to the local paper maps without applying a transformation, because equipment might well be in use that cannot apply transformations.

To me the above is so blinding obvious that I can't see how anyone can argue against it...

Not really practical, the maps may be of many scales. Also when you are talking of one of our user services, the map is quite likely to be displayed on one of their GIS computer screens.

; -)

We've been under severe time pressure before to convert coordinates from one datum to another, or check them against paper maps quickly during SAR activities. I can verify that it's not a good feeling to have people breathing down your necks saying "aren't you done yet?" when a helo or an ambulance is ready to launch. Compounding that problem is the "what lat/long format did they give it to us in?" question, which occurs all too often.

In an emergency situation, faster is better, however that can be accomplished without losing accuracy.

I vote for allowing different datums on the air, but requiring each and every packet with a non-WGS84 datum to specify the datum in a machine-parsable _and_ human-parsable format. That way we can adapt to different situations/regions quickly and easily. The APRS client software can be upgraded over time to parse and convert these to the datum the operator is currently using for map display.

Sure it is, in the case of a new protocol that's not already
widely deployed. OpenTRAC isn't already deployed on a
bunch of legacy devices (like TH-D7s), so it can establish any
protocol it wishes. There's a real advantage to expressing
the position in a well-known form and allowing 'localization'
at the clients, since the clients know where they are and what
the display requirements are.

The potential downside is that some senders will convert from one
datum to WGS 84, only to have a receiver convert back to the original
datum. Wasted work but no harm done as long as the conversions are
consistent.

A real issue might be the ability to deploy OpenTRAC clients,
but that is another thing.

Roger, I know where you're coming from, I just don't know if this is the best way to do it. GPS receivers use WGS84, and to my knowledge there's no standard way to make sure the serial output is anything else. Where are the coordinates read from that are passed to the emergency services personnel? A PC should have no problem performing conversions on the receiving end (my PC here has a database of 975 reference systems), so I can only see it as being a problem if they're looking at a Kenwood or something. Which isn't something I'd want to subject my local emergency dispatcher to.

Ok, I'll admit that map overlays aren't the easiest solution. Now that I've had lunch and I'm not so grumpy. Dang diet. =]

So I guess the issue is being able to pass through non-WGS84 coordinates from appropriately configured trackers to dumb clients in a consistent manner. Which I'll concede might be convenient in certain circumstances. I just cringe every time we've got to tack more data onto the comment field, and add more complexity to the clients.

Scott

Another place to put the datum would be on the end of the digpeater field.

I konw the purists wont like that, but it is a free field that is optional
and doesnt mess up anything while still allowing the full use of the
Position comment field or status fields.

And it allows up to 6 charactetrs...

Just a thought...
Bob

So, we're going to rule out the use of TH-D7s, TM-D700s, simple terminal programs, etc, because of some "rule" that APRS has to use WGS-84 on air? If there's an emergency, we only allow hams to help who have suitably sophisticated equipment? Even if, in some situations, a TH-D7 is far more practical than a PC?

Ok, I give up. We're on different planets...

Read the rest of my message... I'm conceding that your way makes sense for certain situations. I don't like it, but considering the hardware that's out there now and how you want to use it, it's practical. I just won't be doing it that way in OpenTrac. Which shouldn't really be a problem, as long as everyone knows from the start that's how it's going to be and understands they'll have to take care of the translation if they want to use any other system.

Honestly, I'm not trying to start flame wars here... just stating my opinion.

Scott

I would have no problem with that. We typically don't need all eight digipeater fields for APRS uses on RF.

How about having it in the last used digipeater path -or- in the comment field? Allow two options.

Do any of the firmware-based APRS rigs have restrictions on the formation of a digipeater callsign? If so, or even just to provide

I would have no problem with that. We typically don't need all eight digipeater fields for APRS uses on RF.

How about having it in the last used digipeater path -or- in the comment field? Allow two options.

Do any of the firmware-based APRS rigs have restrictions on the formation of a digipeater callsign? If so, or even just to provide more flexibility, the datum could be specified either way.

If this can be agreed upon then we'll need some parsable strings for specifying the datums within 6 characters plus a digit or two. Hopefully some standard table used in GIS applications can be adopted directly so there's no ambiguity as to the choice of strings and proper parsing is guaranteed.

Scott,

Most modern GPS's I've seen can be set to almost any datum and will send position data to that datum in the NEMA sentences. There are a few that are WGS84 only and a few that are difficult to change. I agree it's not normally possible to determine the datum from the NEMA data, the datum in use would have to be entered manually.

A practical scenario is as follows :

Someone is sent to a location (defined by the emergency service) and the co-ordinates are given using OSGB36.
They will have their GPS set to OSGB so they can find the correct position.
The progress of the person is monitored and plotted on maps (all in OSGB).

In addition objects may be transmitted where their positions have been entered manually, having been read from paper maps.

The location of the objects will be read from the screen and passed to the user service.

So far, so good, everything is in OSGB

Then, someone else, (who has a GPS that only does WGS84) is sent to the same location. They will probably find the location ok but they will never appear that they have and there is no way of telling that the two users are using a different datum.

(We'll ignore the fact that in the UK we normally don't normally use Lat/Long either, its normally NGR :-) but we can get over that more easily.)

Garmins output a proprietary sentence "\$PGRMM" which tells us the horizontal datum used. I don't know about other brands. Some Garmins may not put out this sentence, and in fact I can turn on/off individual sentences in one of my Garmins.

If it can be parsed automatically it should be, but there must be an option to enter it manually into APRS clients as well (I heartily agree with you!).

Here are some sentences that may be of interest:

"\$GPD TM". May be a datum sentence, not sure, never actually seen one of these.

"\$PGRMC". Contains earth datum index, details about the datum used such as semi-major axis, inverse flattening, etc.

"\$PGRMM". Currently active horizontal datum. Looks like this:

\$PGRMM,WGS 84*06

Here is your chance to become rich and famous! Well, maybe not rich, but certainly famous.

The editorial board of Packet Status Register (PSR, TAPR's quarterly newsletter) is now soliciting articles, news items, etc. for the next issue of the newsletter. Topics related to digital Amateur Radio will be given preference and the editorial board reserves the right to determine what is suitable for publication.

E-mail your contributions to wallou@tapr.org ASAP because the deadline for the next issue of the newsletter is April 24.

Don't forget, if you are a TAPR member, you will add three months to your TAPR membership for every article that is published in PSR.

73,

Stan Horzepa, WA1LOU, PSR Editor

This discussion is very interesting for me but sometimes also funny! I'll explain, why: WGS-84 is the internationally selected map datum for ALL countries around the world but there seem to be countries not willing to adopt it for their paper maps. On the other side there is a country using this map datum but not using standards on very lower levels (speed, distances etc.) that have been standardised long before. But they are saying that they are correct.

For our German paper maps I can say, that most of them are available with WGS-84 and have our local system on the same map (Gauss-Krueger with Potsdam-23) as a grid in a different colo(u)r. On ALL electronic maps available from official sources you can switch coordinate systems (and map datums at the same time). So for an SAR-mission it would be possible to print out maps to be used for the needed area to be supplied to the rescue teams. Are there no electronic maps (with hopefully switchable datums) to be printed out available for the UK? At least for SAR-missions?

Just my two EUR-cts.

I have researched datum conversion and gave up on-the-fly conversion because of the complexity, performance issues and margin for error. I am not a mathematician however, and strictly a novice GIS enthusiast.

As I understand it, the original datum is first converted to a reference ellipsoid, then to the target datum in a multi-step process. Lots of floating point math. The method varies, but in some cases up to 7 parameters are required for every datum you wish to convert.

Take a look at the Molodensky transform here:

<http://www.colorado.edu/geography/gcraft/notes/datum/gif/molodens.gif>

Here is a page I book marked for reference:

<http://www.colorado.edu/geography/gcraft/notes/mapproj/mapproj.html>

One issue I ran into is that even experienced GIS users don't completely understand datums. Almost everyone new they were using NAD83, but had no idea which projection (UTMxxx). This makes a world of difference if you are trying to convert ESRI shape files to something useable in WGS84 for APRS. Don't even think about mentioning the reference spheroid/ellipsoids etc.

It makes a lot of sense that our friends in GB would use the same datum their public safety agencies use. At least their more consistent that the US where many GIS shops are still using NAD27, most are moving towards NAD83 (various projections) and WGS84 for GPS.

It would be nice to know if a posit is in a datum I don't expect, but I'm not sure what I would do about it if I did.

Regards,

Rich - Wn0x

I have a Perl5 module that easily does the conversions between many different datums. Xastir has datum.c and datum.h which do the same thing (in fact the Perl5 and C code were derived from the same source originally).

It's certainly possible to do it on the fly. Whether you'd want to on a particularly busy internet stream (or lots of them at once!) is quite another question.

Converting them as they come in from RF wouldn't be difficult, and if it was assumed that they were WGS84 unless otherwise identified, the conversion load would be greatly decreased.

Thanks for clearing that up Gerry.

A year or two ago someone contributed a couple of articles on maps/datums to the APRSSIG. I wish I had kept them because they were a great intro to the subject and were a fairly detailed description of reference spheroids, ellipsoids and map projections.

Ditto on the meta data. I have run across several maps I would have loved to have, but after playing unsuccessfully for hours trying to determine the projection and get a usable map I gave up. I have ArcView 3.2 and 8 available, but I believe version 8 is the only version I have that has a datum conversion tool.

What is your opinion of decimal degree vs degree/minutes/second? Everything I have written is based on decimal degree because I like working with that format. Performance issues aside (floating point math), 5 decimal places will give you pretty good positional accuracy and only requires 8 bytes per posit.

Greetings,

Is there a draft updated spec anywhere or otherwise a summary of new features since the 1.0.1 spec was published? I am working on a new release of aprsdigi and would like to throw in any interesting new (experimental) features.

Thanks, Bob. A quick read seems to indicate that the only areas to concern me for a digipeater/router that are not in spec 1.0.1 is the APRS-IS q-construct.

Does this sound right?

When a 3rd party packet is de-tunneled, the source-path header is inserted in front of the payload, prepended with the "{" character. It is not clear from the spec, assuming the detunneling is going back to an ax.25 network, what the ax.25 addresses should be. I am assuming it is the from-call of the digipeater, to-call "APRS". But what is the content of the digipeater list?

This informative link should be added to the TAPR page that hosts the spec.
Anyone know how to accomplish this?

Announcing the 2003 TAPR Digital BASH!

What?

An event for the digitally-inclined ham, featuring:

- * Buffet dinner
- * Keynote Address: A Software Defined Radio for the Masses,
by Gerald Youngblood, AC50G
- * TAPR special interest group meetings
- * "Birds of a Feather" gatherings

When?

Friday evening, May 16, 2003

Doors open at 7:00 pm; dinner served at 7:30 pm

Speaker and meetings after dinner

Where?

Kohler's Banquet Center, 4548 Presidential Way, Kettering
(39 40.75N, 84 08.43W), just south of East David Road between Far
Hills Ave. and Wilmington Pike. Maps available on the TAPR web site
(<http://www.tapr.org/tapr/dayton>, follow the link at the bottom of the

page),

or at the TAPR booth.

How?

Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The
cost is \$25.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing a
dinner can eat.

To register, contact:

Digital BASH

c/o TAPR

8987-309 E. Tanque Verde Road #337

Tucson, AZ 85749-9399

Phone: 972-671-TAPR (8277)

Fax: 972-671-8716

Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?

PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio, the national leader in digital communication -- and the Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to
<http://www.tapr.org/tapr/dayton>,
or send email to tapr@tapr.org.

I'm searching for the ability to announce WWV data via APRS. The APRS Protocol Spec appears to be silent on this use (I've searched on SFI and WWV). Is this true? Will this require "user defined data" and begging for authors to parse for it? :)

Ev, W2EV

SEC is the space arm of NOAA. Dale's weather server issues NWS messages from SEC as they are issued. For instance, SECIND messages are issued every hour listing the current "numbers" relevant to propagation. To see the last one, you can go to <http://www.aprs-is.net/wx/finger.asp> and do a finger on SEC IND. You will get the full text. If you then check the APRS Format box, you will see how it goes out to APRS-IS.

You can also go to <http://www.findu.com/cgi-bin/msg.cgi?call=SECIND> to see the recent history.

I have been gating all SEC packets to RF for the past few years here in the Dallas area. They do not add much load at all (usually no more than 1 packet per hour) and the information is of interest to the amateur radio community (at least those of us that have an interest in propagation).

Hope this helps.

Hi Bob,

Is there a standard APRS format for such data, or is it just free-form comment text?

Ev

Hi Pete,

Yes, this helps. How do you gate the reports to RF? What format do they take? Does any APRS software parse and display it? Questions, quesitons. :)

There are two formats for weather messages now used by Dale's weather server. If it is an alert, warning, etc., the message TO field will start with NWS (per the spec). If it is just informational, such as the hourly reports, the message TO field starts with SKY. This is from a finger that I just did:

```
SECIND>APRS::SKYSEC :Flx... A012 BK322.....  
PlnK322.....Ep112A809b379bEe425E952B {CAaAA  
SECIND>APRS::SKYSEC :Flx... A012 BK322.....  
PlnK322.....Ep966_846b364bEe414E976B {CBaAA  
SECIND>APRS::SKYSEC :Flx... A011 BK3222....  
PlnK3222....Ep153A108a638bEe465E111C {CCaAA  
SECIND>APRS::SKYSEC :Flx... A011 BK3222....  
PlnK3222....Ep163A102a347bEe533E143C {CDaAA
```

Note that these are standard message format. You have the solar flux number (... means not available for that report), A and K numbers along with the E flux numbers. If you play with <http://www.aprs-is.net/wx/finger.asp> as indicated before, you can see the full text message that corresponds to the last APRS packet sent.

I have APRS+SA set up to gate to RF anything from callsigns starting with SEC (SEC* is the actual setting in APRS+SA). These messages all originate from SEC so they get gated to RF.

As for software parsing it, all software should parse it. You may need to add SKYSEC to your group bulletin list to see the informational messages.

Hope this helps. I have found it very helpful, especially when there have been solar flares. I have usually found a warning issued via SEC before the band I am working goes dead.

High quality information, as usual, Pete. I'm unsure how to get this information from wherever it resides and put it on RF (which is what I want to do as part of the PropNET/BEACONet project). I'll ask further questions on this topic off-list as this is neither tactical or emergency in nature. :)

Thanks, sincerely.
Ev, W2EV

I'm working on a simple AX.25 encoder system to be used in an ultracheap KISS TNC and a MIM-style telemetry module, and I've got a question some of you might be able to answer.

To generate the FSK tones, I'm using a sine lookup table to drive a pulse-width modulated output. The PWM output goes through an RC circuit to smooth it out, and ideally should go into a low-pass filter to remove the carrier and harmonics generated by the PWM sample frequency. My question is, if I'm feeding the audio into a radio, how necessary is that filtering? Is the radio itself going to have a low-pass filter? If filtering is necessary, can someone recommend a simple filter circuit?

The desired output frequencies are 1200 and 2200 hz, of course, and the PWM sample rate will probably be around 32 or 64 khz. Maybe less, if practical.

Please forgive my ignorance on this subject... I'm a digital guy, and my analog experience is seriously lacking.

Thanks...

Scott

Just a reminder that the annual TAPR Digital BASH will be held Friday evening at Hamvention. Our keynote speaker will be Gerald Youngblood, AC50G, who will describe -- and demonstrate -- his HF software defined radio, the SDR-1000. I have been playing with the SDR-1000 myself, and it is a real step forward for ham SDR experimentation. If you're at Hamvention, you'll want to hear Gerald and see the radio in action.

Tickets are \$25 and will be available at the TAPR booth up until about 3:45 Friday afternoon, when we have to call in the final count. Directions to the banquet hall will also be available at the booth.

And, remember that TAPR will have a bigger and better presence at Hamvention this year. Our new booth spaces are 607, 608, and 615, just a little bit down and over from our old spot.

See you there!

73,
John N8UR
